Title: us-10-646-391a-1  
Perfect score: 1676  
Sequence: 1 gaattccgcgtgaccgag.....aaaaaaaaaagaattc 1676

Scoring table: IDENTITY NUC  
Gapop 10\_0 , Gapext 0.5

Searched: 1187 seqs, 22896 residues

Total number of hits satisfying chosen parameters: 2374

Minimum DB seq length: 8  
Maximum DB seq length: 50

Post-processing: Minimum Match 0%  
Maximum Match 100%  
Listing first 1187 summaries

Database : rgedb:\*

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

CC	The present invention relates to detecting a mutant polynucleotide in a
CC	mixture of mutant polynucleotides, wild-type polynucleotides and
CC	unrelated polynucleotides, comprises using polymerase chain reaction
CC	amplification of extension products produced from mutant polynucleotide
CC	templates and by extension primers and probes. The method is useful in
CC	detecting mutated polynucleotides within a large population of wild-type
CC	polynucleotides. The method may be used in diagnosing or detecting
CC	cancer, such as colorectal cancer, in an individual. The present sequence
CC	represents a probe of the invention.

PT	Production of cytochrome c by culturing prokaryote transformed with
PT	vector containing e.g. DNA of signal peptide and of eukaryotic cytochrome
PT	c maturation protein for use in reagents and drugs for trapping nitrogen
PT	oxide.
XX	
PS	Example 1; Page 7-8; 27pp; Japanese.
XX	
CC	The invention comprises a method for the production of cytochrome C. The
CC	method involves culturing a prokaryote that has been transformed with a
CC	vector encoding a signal peptide and a cytochrome C maturation protein.
CC	The method of the invention is useful for producing cytochrome C.
CC	Cytochrome C produced by the method of the invention is used in reagents
CC	and drugs for trapping nitrogen oxide (e.g. in purifying polluted
CC	atmosphere by trapping nitrogen oxide). The present DNA sequence
CC	represents a Porphyra yezoensis cytochrome C - related PCR primer

PT  New chemically inducible promoter from Arabidopsis - used to regulate
PT  gene expression in response to e.g. salicylic acid.
XX
PS  Example 9; Page 32; 60pp; English.
XX
CC  Primer P41+ corresponds to nucleotides -735 to -706 relative to the
CC  transcription start site in the upstream region (see AAV15448) of the
CC  Arabidopsis PR-1 gene (see AAV15448). It was used in non-coding strand
CC  analysis of the PR-1 promoter region. In vivo footprinting analysis was
CC  performed of the PR-1 promoter region. Inducible in vivo footprints are
CC  located at positions -629 and -628 and at position -604 on the coding
CC  strand and at position -641 on the non-coding strand. The use of PR-1
CC  promoter fragments to regulate gene expression in plants in the presence
CC  of chemical inducers is disclosed

PT  Detecting or diagnosing a kidney disease, e.g. renal cancer or
PT  glomerulonephritis, comprises determining the presence of expression of a
PT  podocyte gene for nephrin or proximal tubular cell gene for Indian
PT  hedgehog in a urine sample.
XX
PS  Claim 39; Page 24; Opp; English.
XX
CC  The present invention relates to a method of detecting a kidney disease,
CC  which comprises screening a mammalian urine sample for expression of a
CC  specific gene that is present in the urine sample only when cells
CC  indicating kidney disease are present, where the concentration of
CC  detectable albumin in the urine sample has a range of 0-30 mg/dl. The
CC  method is useful for detecting or diagnosing a kidney disease or
CC  disorders associated with e.g. glomerulonephritis, nephritic syndrome,
CC  diabetes, lupus, hypertension, acute tubular necrosis, renal obstructive
CC  disorders, renal cancers, and other diseases or symptoms. The podocyte
CC  gene for nephrin or the proximal tubular cell gene for Indian hedgehog is
CC  useful as selectable markers for a kidney disease. The present sequence
CC  is a PCR primer used to detect the human beta-actin gene

 XX DNA sequence coding for cytolytic inhibitor - is strong inhibitor of  
 PT terminal complement protein, e.g. perforin secreted by killer cells.  
 XX  
 XX Example 1; Page 4; 15pp; German.  
 XX  
 CC The partial amino acid sequences of both chains of the Cytolysis  
 CC inhibitor were known. This probe is one of two which were prepared based  
 CC on the N-terminal sequences of the inhibitor. It corresponds to the  
 CC sequence DNEIQMSNQG. Both probes were radioactively labelled and used to  
 CC screen a liver-specific cDNA library. One clone which hybridised  
 CC positively to both probes was found to contain a 1.7kb BamHI-KpnI  
 CC fragment. This was inserted into plasmid pGEM4, to give DSM 5269, and  
 CC sequenced. See also AAQ11502 and AAQ11503.

 PT Analyzing repeat sequences in DNA using a probe which hybridizes to  
 PT adjacent repetitive and non-repetitive regions and determining hybrid  
 PT melting point is useful to detect microsatellite instability such as in  
 PT hereditary cancer.  
 XX  
 PS Claim 16; Page 7; 19pp; English.

XX  
 CC The present invention relates to a method for analysing a target nucleic  
 CC acid consisting of repetitive and non-repetitive sequences. The method  
 CC comprises hybridising a polynucleotide probe comprising a segment  
 CC complementary to a non-repetitive region and a segment complementary to  
 CC an adjacent repetitive region, where the second segment consists of a  
 CC defined number of repeats, and determining the melting point temperature  
 CC of the hybrid. The method is used to analyse microsatellites, especially  
 CC microsatellite instability, particularly as a means for detecting  
 CC hereditary tumours. Alternatively, the method is used to identify an  
 CC individual in a population. The present sequence is a probe for  
 CC Mononucleotide repeat locus BAT26, and was used to illustrate the  
 CC invention

 PT Selective elimination of non-targeted DNA sequences for rapid isolation  
 PT and enrichment of the differences of DNA fragments between two pools of  
 PT DNA, comprises converting testers to drivers.  
 XX  
 PS Claim 6; Col 5; 23pp; English.  
 XX  
 CC The invention comprises rapid isolation and enrichment of the differences  
 CC of DNA fragments between two pools of DNA, comprises converting  
 CC undesirable testers (DNA being subtracted) to drivers (DNA used to  
 CC subtract) and re-utilising converted drivers in repeats of subtraction to  
 CC achieve double exponential elimination of undesirable tester sequences.  
 CC The method comprises (a) attaching a nucleic acid fragment to 1 or more  
 CC polymerase chain reaction (PCR) adapters to form an adapter-attached  
 CC nucleic acid fragment, followed by amplifying the adapter-attached  
 CC nucleic acid fragment through PCR with primers containing nucleic acid  
 CC sequences complementary to nucleic acid sequences of the adapter to form  
 CC an adapter-attached nucleic acid tester, (b) mixing the adapter-attached  
 CC nucleic acid tester with a nucleic acid driver that contains no attached  
 CC adapter or contains an attached adapter whose sequence differs from the

DR New pure contryphan peptides.

XX Example 3; Page 20; 48pp; English.

PS The present sequence represents a PCR primer for a contryphan

CC peptide sequence. Contryphan peptides are found in the venom of cone

CC snails. The contryphan peptides are useful as anticonvulsant agents, as

CC neuroprotective agents, for managing pain, and for treating

CC neurodegenerative disorders, especially those resulting from an

CC overstimulation of excitatory amino acid receptors. The contryphan are

CC useful for the treatment and alleviation of epilepsy and as a general

CC anticonvulsant agent. The contryphan are also useful to reduce

CC neurotoxic injury associated with conditions of hypoxia, anoxia, or

CC ischaemia which typically follows stroke, cerebrovascular accident, brain

CC or spinal cord trauma, myocardial infarct, physical trauma, drownings,

CC suffocation, perinatal asphyxia, or hypoglycaemic events. The contryphan

CC are further useful for the treatment of Alzheimer's disease, senile

CC dementia, amyotrophic lateral sclerosis, Parkinson's disease,

CC Huntington's disease, Down's syndrome, Korsakoff's disease,

CC schizophrenia, AIDS dementia, multi-infarct dementia, and neuronal damage

CC associated with uncontrolled seizures. The contryphan are further useful

CC in controlling pain and are effective in the treatment of migraine. They

CC can be used prophylactically or to relieve the symptoms associated with a

CC migraine episode

DR Synthetic nucleic acid probes - comprising two nucleic acid sequences

PT linked by a scissile linkage.

PT Example; p29; 46pp; English.

PS The patent claims a new molecule of formula (NA1----S----NA2)n. NA1 and

CC NA2 are noncomplementary nucleic acid sequences; ---S--- = a scissile

CC linkage; n= 1 or 1,000, which is used for the detection of specific DNA

CC or RNA sequences in a test soln. The scissile link probes may be PL

CC (Permanent Linkage to Solid Support) or HL (Hydrolysable Linkage to Solid

CC Support). The differential liability of DNA and RNA may be exploited in a

CC heterogeneous system when the scissile linkage is an RNA molecule. In the

CC examples, counter probe molecules 9 through 16 were used to determine

CC suitable hybridisation conditions. (Updated on 03-OCT-2002 to add missing

CC OS field.)

XX
XX Detecting target nucleic acid molecules - using excess complementary
XX nucleic acid probes and nicking to complete a cycling sequence.
XX
XX Disclosure; Page 24; 34pp; English.
XX
XX Probe MRC064 is bound by a hydrolysable linkage to a solid support at its
XX 3' end. It is used by reacting excess probe with a target nucleic acid;
XX nicking hybridised probe at least once within a predetermined sequence to
XX form 2 or more probe fragments hybridised to the target sequence, which
XX results in the probe fragments becoming hybridised to another probe; and
XX identifying probe fragments, so detecting the target sequence. The probe
XX can react with target sequence to complete a cycling sequence. Using this
XX system, sensitivity of 10 exp. -19 to 10 exp. -20 molecules of target can
XX be obt'd. The probe is cleavable at the ribonucleotides by a ds RNase, eg
XX RNase H or ExoIII. (Updated on 31-OCT-2002 to add missing OS field.)

PS Example 1; Page 40; 46pp; English.
XX
CC This invention describes a novel method for the visual detection of
CC target nucleic acid presence in a sample. A preferred target is a
CC Mycobacterium complex nucleic acid sequence. The detection method uses
CC visual detection of a change in the hybridization without aid of
CC instrumentation. Multiple copies of a target nucleic acid sequence are
CC mixed with first and second detectable probes under hybridizing
CC conditions favouring particle agglutination via a bridging molecule
CC allowing for visual detection of the target nucleic acid sequence. The
CC bridging molecule enhances or inhibits formation of a hybridization
CC complex

 XX Determining an analyte in a sample, for generating multiple double  
 PT stranded nucleic acids, comprises employing a single primer sequence with  
 PT a nucleobase sequence having affinity to the sequence contained in a  
 PT target nucleic acid.  
 XX Example 1; Col 14; 25pp; English.  
 XX The invention relates to determining an analyte in a sample comprising  
 CC (a) providing a target nucleic acid comprising a region A, a nucleobase  
 CC sequence B, and a sequence I linked to the 5' terminus of the nucleobase  
 CC analyte, and the region A specifically binds to the analyte, (b) binding  
 CC the target nucleic acid to the analyte, separating the analyte bound to  
 CC the target nucleic acid from the remaining part of the sample, (d)  
 CC hybridising a primer to the target nucleic acid, where the primer  
 CC comprises a nucleobase sequence B', and the nucleobase sequence B'  
 CC hybridises to the nucleobase sequence B, (e) elongating the hybridised  
 CC primer to produce an elongation product E using the target nucleic acid  
 CC as a template and using nucleotides, where at least 30 % of the  
 CC nucleotides contain at least one promiscuous base which is capable of  
 CC base pairing with each of adenine, guanine, cytosine, and thymine, (f)  
 CC separating the target nucleic acid from the elongation product E, (g)  
 CC hybridising a further primer which comprises the nucleobase sequence B'  
 CC to the elongation product E, where the elongation product E is capable of  
 CC acting as a template for the elongation of the further primer, (h)  
 CC elongating the hybridised further primer of step (g) to produce an  
 CC elongation product E' using the elongation product E as a template and  
 CC using nucleotides, where at least 30 % of the nucleotides contain at  
 CC least one promiscuous base, (i) separating the elongation product E' from  
 CC the elongation product B', (j) hybridising a further primer comprising a  
 CC nucleobase sequence B' to the target nucleic acid or the elongation  
 CC product E, (k) elongating the further primer of step (j) to produce  
 CC another elongation product E' using the target nucleic acid or elongation  
 CC product E as a template and using nucleotides, where at least 30 % of the  
 CC nucleotides contain at least one promiscuous base, (l) separating product  
 CC E' of step (k) from the target nucleic acid or elongation product E, (m)  
 CC optionally repeating steps (g) - (l) a sufficient number of times to  
 CC generate a desired amount of double stranded nucleic acids and (n)  
 CC determining the elongation product E and/or elongation product E' as a  
 CC measure of the presence or amount of the analyte, where the lengths of  
 CC the sequence I and the nucleobase sequence B are chosen such that, when  
 CC the further primer hybridises to the elongation product E in step (g),  
 CC the further primer spans a sequence formed by elongation of the  
 CC hybridised primer of step (e) and overlaps at least a part of the 3'  
 CC region of the hybridized primer of step (e) by an overlap length. The  
 CC method is useful for determining an analyte in a sample. In particular, the  
 CC method is useful for generating multiple double stranded nucleic acids.  
 CC The present sequence is a primer molecule used to exemplify the method of  
 CC the invention

XX	PT	stranded nucleic acids, comprises employing a single primer sequence with
XX	PT	a nucleobase sequence having affinity to the sequence contained in a
XX	XX	target nucleic acid.
XX	PS	Example 1; Col 14; 25pp; English.
XX	XX	
XX	CC	The invention relates to determining an analyte in a sample comprising
XX	CC	(a) providing a target nucleic acid comprising a region A, a nucleobase
XX	CC	sequence B, and a sequence I linked to the 5' terminus of the nucleobase
XX	CC	sequence B, where the nucleobase sequence B is not specific for the
XX	CC	analyte, and the region A specifically binds to the analyte, (b) binding
XX	CC	the target nucleic acid to the analyte, separating the analyte bound to
XX	CC	the target nucleic acid from the remaining part of the sample, (d)
XX	CC	hybridising a primer to the target nucleic acid, where the primer
XX	CC	comprises a nucleobase sequence B', and the nucleobase sequence B'
XX	CC	hybridises to the nucleobase sequence B, (e) elongating the hybridised
XX	CC	primer to produce an elongation product E using the target nucleic acid
XX	CC	as a template and using nucleotides, where at least 30 % of the
XX	CC	nucleotides contain at least one promiscuous base which is capable of
XX	CC	base pairing with each of adenine, guanine, cytosine, and thymine, (f)
XX	CC	separating the target nucleic acid from the elongation product E, (g)
XX	CC	hybridising a further primer which comprises the nucleobase sequence B'
XX	CC	to the elongation product E, where the elongation product E is capable of
XX	CC	acting as a template for the elongation of the further primer, (h)
XX	CC	elongating the hybridised further primer of step (g) to produce an
XX	CC	elongation product E', using the elongation product E as a template and
XX	CC	using nucleotides, where at least 30 % of the nucleotides contain at
XX	CC	least one promiscuous base, (i) separating the elongation product E
XX	CC	from the elongation product E', (j) hybridising a further primer comprising a
XX	CC	nucleobase sequence B' to the target nucleic acid or the elongation
XX	CC	product E, (k) elongating the further primer of step (j) to produce
XX	CC	another elongation product E using the target nucleic acid or elongation
XX	CC	product E as a template and using nucleotides, where at least 30 % of the
XX	CC	nucleotides contain at least one promiscuous base, (l) separating product
XX	CC	E of step (k) from the target nucleic acid or elongation product E, (m)
XX	CC	optionally repeating steps (g) - (l) a sufficient number of times to
XX	CC	generate a desired amount of double stranded nucleic acids and (n)
XX	CC	determining the elongation product E and/or elongation product E' as a
XX	CC	measure of the presence or amount of the analyte, where the lengths of
XX	CC	the sequence I and the nucleobase sequence B are chosen such that, when
XX	CC	the further primer hybridises to the elongation product E in step (g),
XX	CC	the further primer spans a sequence formed by elongation of the
XX	CC	hybridised primer of step (e) and overlaps at least a part of the 3'
XX	CC	region of the hybridized primer of step (e) by an overlap length. The
XX	CC	method is useful for determining an analyte in a sample. In particular, the
XX	CC	method is useful for generating multiple double stranded nucleic acids.

The present invention relates to a new oligonucleotide label-domain comprising the sequence (CTATTTT)<sub>n</sub> and its complement (AAAAATAG)<sub>n</sub>, where n is 1. The probe sets of the invention are useful for detecting kappa or lambda-immunoglobulin light chain mRNA or corresponding heteronuclear RNA, CMV (Cytomegalovirus) immediate early RNA, EBV (Epstein-Barr virus) early RNA 1 and RNA 2, and human A1u repetitive satellite genomic sequences. The invention is a useful generic sequence for incorporation into oligonucleotide probes for detecting gene-specific sequences within cells or tissue samples in situ hybridisation analysis and for attaching a label to immunoglobulins or other proteins for detecting haptens and antigens in immunohistochemical analyses. The present nucleic acid sequence represents one of a collection (ABK70376-ABK70501) of oligonucleotide probes that were used in the invention for detecting or localising a plurality nucleic acid target gene or antigen within a cell or tissue sample

XX
XX Fluorescent dye or its salt, hydrate, solvate or stereoisomer for nucleic
PT acid probe for measuring nucleic acid(s) containing specific nucleic acid
PT sequence in sample, has specific formula.
XX
XX Example 5; Page 33; 40pp; English.
XX
XX The invention describes a novel fluorescent dye and method of detecting
CC nucleic acid. The dye and method are useful for nucleic acid probes for
CC measuring nucleic acid(s) containing a specific nucleic acid sequence in
CC a sample, and for qualitative/quantitative assay of target RNA containing
CC specific base sequence anticipated in gene mixture. The assay is useful
CC in gene diagnosis and other areas of clinical diagnostics and in
CC identification/quantification microorganisms in biological samples such
CC as serum, plasma and urine, microbially contaminated samples from food,
CC rooms, soil, rivers and sea. The fluorescent intercalative dye shows a
CC large fluorescent enhancement upon intercalation into double-stranded
CC nucleic acid, and shows a great difference between excitation and
CC emission wavelengths (has a large Stokes shift) and does not have a
CC fluorescent spectrum that overlaps with those of conventionally known
CC fluorescent intercalation dyes. Viruses, microbial RNAs, specific
CC sequences in one RNA, are detected or quantified in a short time, hence
CC the detection method is applicable to clinical diagnosis which requires
CC high reliability. Amplification and extraction efficiencies of the target
CC nucleic acid, are checked. This sequence represents a synthetic DNA used
CC as the target in an assay to detect double stranded DNA

CC This invention relates to a kit for the detection and typing of small  
CC round structured virus (SRSV) strains. The kit contains antibodies  
CC directed against peptides represented in sequences AAB49700 - AAB49710,  
CC which are each SRSV strain specific. Polynucleotide sequences AAF20141 -  
CC AAF20151 represent cDNA encoding the strain specific proteins. The kit is  
CC used for detecting and typing strains of SRSV in order to prevent the  
CC spread of infection and to examine the epidemiology of outbreaks. PCR  
CC primers AAF29152 - AAF29163 are used to amplify SRSV strain specific cDNA  
CC sequences.

RESULT 26  
ABX12469/C  
ID ABX12469 standard; DNA; 27 BP.

The invention describes a polymerase chain reaction (PCR) and primers for detecting nucleic acids from the diabetogenic coxsackie B virus-4 (CBV-4) strain VD2921, (particularly VP1, VP2, VP3, VP4, P2A, P2B, P2C, P3A, P3B, P3C and P3D nucleic acids). The methods and primers are used for the detection of CBV-4 strain VD2921 which is associated with diabetes (diabetogenic enterovirus). Early detection of the diabetes e.g. detection of diabetogenic enteroviral RNA in peripheral mononuclear cells, can improve prognosis by allowing treatment e.g. with antiviral drugs, to prevent further loss of beta cells and severe long term consequences of diabetes including blindness, renal failure and leg amputations. This sequence represents a primer used to determine the genomic structure of diabetogenic coxsackie B virus 4 (CBV-4) strain VD2921

XX Composition of matter useful for multi-component analyses, comprises
PT multiple fluorophores bound to molecular scaffold at preset positions to
PT permit fluorescence energy transfer between two fluorophores.
XX Disclosure; Page 43; 113pp; English.
XX This sequence represents a molecular scaffold which may be used in a
CC composition of matter comprising multiple fluorophores. The fluorophores
CC are bound to the molecular scaffold at separate predetermined positions,
CC to permit fluorescence energy transfer between two fluorophores. The
CC fluorophores are characterized by maximum emission wavelength of one
CC being greater than the minimum excitation wavelength of the other. The
CC composition is useful for determining whether a preselected nucleotide
CC residue is present at a predetermined position within a nucleic acid. It
CC is also useful in multi-component analysis including multiplex biological
CC analysis, and identifying multiple single nucleotide polymorphisms. The
CC presence of a number of given nucleotide residues is determined
CC simultaneously by the composition of the invention

XX Producing sub-population of labeled nucleic acids, useful for analyzing
PT differences in RNA profiles between several different physiological
PT sources, using set of distinct gene specific primers.
XX Example 3; SEQ ID NO 747; 11pp; English.
XX The invention relates to producing a sub-population of labeled nucleic
CC acids (NAs) comprising contacting a NA sample from a physiological
CC source, with a pool of 50 distinct gene specific primers under suitable
CC conditions to enzymatically generate sub-population of NAs, where each
CC gene specific primer has a sequence complementary to a distinct mRNA, and
CC each labeled NA is generated using a single gene specific primer. The
CC method is useful for producing a sub-population of labeled NAs which is
CC useful for analysing the differences in the RNA profiles between several
CC different physiological sources, where the method comprises producing
CC subpopulation of labeled NAs for the different physiological sources,
CC comprising the populations for each physiological source to identify
CC differences in the population, where the comparison is preferably
CC performed by hybridising the labeled NAs for each of the distinct
CC physiological sources to an array of probe NAs stably associated with the
CC surface of a substrate to produce a hybridisation pattern for each of the
CC sources, and comparing the patterns for each of the sources, where
CC differential gene expression assays are utilised in differential
CC expression analysis of diseased a normal tissue e.g. neoplastic a normal
CC tissue, or different tissue or subtype types. The present sequence is a
CC human gene specific PCR primer used in the method of the invention. Note:
CC The sequence data for this patent did not form part of the printed
CC specification, but was obtained in electronic format directly from USPTO

XX New zalphall ligand polypeptides and polynucleotides, useful for stimulating proliferation, activation, differentiation and/or induction of inhibition of specialized cell function, or for stimulating an antigenic response.  
XX Example 7; Col 139; 105pp; English.  
PS The present invention relates to the isolation of a novel cytokine, zalphall ligand and the polynucleotide encoding it. The invention also gives the sequence for the zalphall receptor and the polynucleotide encoding it. The zalphall ligand polypeptide stimulates proliferation of natural killer (NK) cells or NK cell progenitors, the activation of NK cells, proliferation of T-cells, proliferation of B-cells stimulated with anti-CD40 antibodies, stimulates an antigenic response in a mammal, and reduces proliferation of B-cells stimulated with anti-IGM antibodies. The zalphall ligand polypeptide is also useful in preparing antibodies that bind to zalphall ligand epitopes. The zalphall ligand polynucleotides can be used as probes or primers to clone regions of a zalphall ligand gene, and in gene therapy. Zalphall ligand may also be used to identify inhibitors of its activity, to enhance the generation of anti-tumour responses with or without the infusion of donor lymphocytes, and to activate or stimulate the immune system. The present sequence represents a sequencing primer used to sequence cDNA clones in the isolation of human zalphall ligand

PI WPI; 2002-636542/68.  
XX Obtaining single stranded polynucleotide tags from a biological sample, for analyzing gene expression or diagnosing clinical conditions, comprises employing nicking endonucleases that cleave complementary strands.  
XX Example; Page 294; 302pp; English.  
XX The invention relates to a method for obtaining a single stranded polynucleotide tag from a biological sample by cleaving one of the complementary strands of a double stranded polynucleotide with a cleavage agent capable of recognising a double stranded polynucleotide comprising complementary strands and cleaving only one of the strands of the polynucleotide in the process of generating a single stranded polynucleotide tag. The method is useful for separating, analysing, quantifying or obtaining single stranded polynucleotides comprising tags originating partly, and preferably wholly from a source of DNA and/or RNA in a sample comprising biological cells. The method is particularly for analysing gene expression (expression profiling or differential gene expression), or in diagnosing clinical conditions. The present sequence is a primer used in the exemplification of the invention

PT New oligodeoxynucleic acid molecules useful for the preparation of
PT vaccine.
XX

```

---

```

PS Example 8; Page 32; 57pp; English.
XX
CC The present sequence is that of a thiosubstituted oligodeoxynucleic acid
CC (ODN) molecule, ODN 24, including deoxyuridine monophosphates. The
CC invention is based on the discovery that ODNs containing deoxyuridine
CC residues (U-ODNs) have an immunostimulatory effect comparable to, or in
CC many instances greater than, ODNs containing CpG motifs, producing higher
CC numbers of specific T cells to a given antigen. The U-ODNs do not induce
CC the systemic production of pro-inflammatory cytokines and, in contrast to
CC CpG ODNs, are not dependent on a specific motif or a palindromic
CC sequence. Use of a U-ODN for the preparation of a vaccine is claimed.
CC Combining the U-ODN with an antigen strongly increases the potential of
CC the antigen to raise the protection/immune response of a vaccinated
CC individual. An example of the invention demonstrated the generation of a
CC specific immune response against a melanoma-derived peptide (see
CC ABP58360) by injection of mice with the peptide in combination with ODN

PT Improved polymerase thermocycling reaction for nucleic acid
PT amplification, by thermal cycling of promoter-linked nucleic acid
PT template synthesis and in vitro transcriptional amplification of nucleic
PT acid sequences.
XX
PS Example 4; Page 14; 28pp; English.
XX
CC The invention relates to an improved polymerase thermocycling reaction
CC (M1) for linear amplification of nucleic acid sequences, involves
CC denaturing a number of nucleic acid templates (I), combining the
CC denatured (I) with a promoter-containing primer (P1), a primer (P2), a
CC number of deoxynucleotide triphosphates and ribonucleotide triphosphates,
CC a reverse transcription enzyme, a DNA-dependent DNA polymerase and RNA
CC polymerase, contacting P1 with (I) to generate a number of promoter-
CC containing templates, denaturing the promoter-containing templates,

```

CC contacting P2 with the denatured promoter-containing templates to  
 CC generate a number of promoter-containing double-stranded DNA templates,  
 CC where the double-stranded nucleic acid templates are flanked by P1 in one  
 CC end and P2 in the other end of the other orientation, transcribing the  
 CC promoter-containing double-stranded DNA templates to form a number of  
 CC amplified RNA sequences, including the primer region of the promoter-  
 CC containing double-stranded DNA templates, contacting the amplified RNA  
 CC sequences with P2 to form a number of cDNAs and a number of DNA-RNA  
 CC hybrid templates, and denaturing the DNA-RNA hybrid templates. The method  
 CC is useful for improved polymerase thermocycling reaction for linear  
 CC amplification of nucleic acid sequences, and thus for producing mRNA  
 CC expression profile of a cell by MI to generate multiple copies of the  
 CC mRNA. MI is also useful for determining aberrant protein production of  
 CC cells in a diseased state, by generating an expression profile by the  
 CC above method, of cells in both normal and diseased states, comparing the  
 CC expression profile of the cells in the normal and diseased states,  
 CC determining the differences in mRNA composition of the cell(s) in the  
 CC diseased state, isolating the mRNA sequences of cell(s) in the diseased  
 CC state that differ from mRNA in cell(s) in non-diseased state, amplifying  
 CC the isolated mRNA by MI, and determining aberrant protein function of the  
 CC protein coded for by the isolated mRNA. MI is also useful for treating a  
 CC cell in a diseased state caused by aberrant protein production, by  
 CC determining protein expression of a cell in a diseased state, determining  
 CC the mRNA sequence for the aberrant proteins, synthesising an antisense  
 CC sequence of the mRNA, amplifying the antisense mRNA sequences by MI, and  
 CC delivering a pharmacutically effective dosage of a composition  
 CC comprising the anti-sense mRNA and a compatible lipid based biological  
 CC carrier. MI is also useful for predicting the efficacy of a proposed drug  
 CC targeted against an aberrant protein, by determining aberrant protein  
 CC production of cell in a diseased state by the above method, amplifying  
 CC the aberrant protein by MI and using recombinant techniques to determine  
 CC the effect of proposed drug on the aberrant protein. MI is also useful  
 CC for differential screening of tissue-specific gene expression at a  
 CC cellular level, for preparing labeled RNA/DNA probes for a gene chip  
 CC technology, and for determining the efficacy of a drug regimen against a  
 CC gene or its cDNAs. The present sequence is an Oligo (dT) primer used to  
 CC produce second strand cDNA in the method of the invention

DR Stimulating an immune response in a mammal exposed to an antigen or  
 PT pathogen, useful for enhancing anti-tumor activity resulting in reduced  
 PT tumor progression or metastasis, comprises administering zalphall ligand  
 PT polypeptide.  
 XX

PS Example 7; SEQ ID NO 39; 103pp; English.

XX The invention relates to stimulating an immune response in a mammal  
 CC exposed to an antigen or pathogen comprising administering a composition  
 CC comprising mature zalphall ligand polypeptide comprising residues 32-162  
 CC of ADH44572 in a pharmaceutical vehicle. Also included are stimulating an  
 CC immune response in a mammal exposed to an antigen or pathogen  
 CC (comprising: (a) determining (in)directly the level of antigen or  
 CC pathogen present in the mammal; (b) administering a composition  
 CC comprising zalphall ligand polypeptide in a pharmaceutical vehicle; (c)  
 CC determining (in)directly the level of antigen or pathogen in the mammal;  
 CC and (d) comparing the antigen or pathogen level in (a) with (b), where a  
 CC change in the level indicates stimulation of immune response), and  
 CC stimulating an immune response in a mammal exposed to an antigen or  
 CC pathogen (comprising: (a) determining a level of antigen- or pathogen-  
 CC specific antibody; (b) administering a composition comprising zalphall  
 CC ligand polypeptide in a pharmaceutical vehicle; (c) determining a post  
 CC administration level of the antigen- or pathogen-specific antibody; and  
 CC (d) comparing the level of the antibody in (a) with (b), where an  
 CC increase in the antibody level indicates stimulation of immune response).  
 CC The method is useful for stimulating an immune response in a mammal  
 CC exposed to an antigen or pathogen, and for enhancing anti-tumour activity  
 CC resulting in a reduction in tumour progression, decrease in metastasis,  
 CC or tumour stasis. The tumour may be a haematopoietic tumour, a lymphoma  
 CC or a B cell tumour. The zalphall ligand is useful for treating a wide  
 CC range of diseases arising from defects in the immune system, e.g.  
 CC systemic lupus erythematosus, rheumatoid arthritis, myasthenia gravis, or  
 CC diabetes, for boosting immunity to infectious diseases, treating  
 CC immunocompromised patients, such as HIV+ patients and in improving  
 CC vaccines. The present sequence is a sequencing primer used in the  
 CC exemplification of the invention.

PS Example 7; SEQ ID NO 39; 111pp; English.

CC The invention describes an isolated polypeptide comprising a sequence of

CC amino acid residues that is at least 90 or 95% identical to residues 41

CC (Gln) to 148 (Ile), or 32 (Gln) to 148 (Ile) of a sequence of 162 amino

CC acids (SEQ ID NO:2, human zalphall ligand), fully defined in the

CC specification. Also described are: a pharmaceutical composition

CC comprising the polypeptide, and a vehicle; a method of treating cancer in

CC a mammal; a method of stimulating an immune response in a mammal with

CC melanoma; an isolated polynucleotide comprising a sequence of nucleotides

CC that encode amino acid residues cited above, where the polynucleotide

CC encodes a polypeptide that binds a receptor comprising 538 amino acids,

CC fully defined in the specification; a pharmaceutical composition

CC comprising the polynucleotide encoding, in a pharmaceutically acceptable

CC vehicle, an expression vector comprising the following operably linked

CC elements: a control element; and a DNA segment comprising the

CC polynucleotide; and an isolated polynucleotide molecule comprising at

CC least 10 nucleotides of the polynucleotide sequence of 642 bp, fully

CC defined in the specification. The molecules, compositions and methods are

CC useful for treating cancer, e.g. melanoma, solid tumour, haematopoietic

CC tumour, or lymphoma. This sequence represents a primer used in the

CC expression cloning of human cytokine zalphall ligand.

FT Detecting target nucleic acid molecules - using excess complementary
FT nucleic acid probes and nicking to complete a cycling sequence.
XX
PS Disclosure; Page 24; 34pp; English.
XX
CC Probe MRC046 is bound by a permanent linkage to a solid support at its 3'
CC end. It is used by reacting excess probe with a target nucleic acid;
CC nicking hybridised probe at least once within a predetermined sequence to
CC form 2 or more probe fragments hybridised to the target sequence, which
CC results in the probe fragments becoming hybridised to another probe; and
CC identifying probe fragments, so detecting the target sequence. The probe
CC can react with target sequence to complete a cycling sequence. Using this
CC system, sensitivity of 10 exp. -19 to 10 exp. -20 molecules of target can
CC be obtd. The probe is cleavable at the ribonucleotides by a ds RNase, eg
CC RNase H or ExoIII. (Updated on 31-OCT-2002 to add missing OS field.)

PS      Claim 101; Page 56; 338pp; English.
XX
CC      The present invention relates to a method for stimulating an immune
CC      response. The method comprises administering an immunostimulatory nucleic
CC      acid to a non-rodent subject in sufficient quantity to stimulate an
CC      immune response. The present sequence is one such immunostimulatory
CC      nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich
CC      (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects
CC      against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae
CC      and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma,
CC      haemophilus, campylobacter, clostridium, Escherichia coli and/or
CC      staphylococcus), fungal antigens and/or parasitic antigens. The method is
CC      also useful for preventing cancer, asthma, infectious disease, allergy or
CC      immune deficiency. The present sequence can also be used to redirect a

```

CC Th2 to a Th1 immune response and to activate immune cells. Note: the  
 CC present sequence may have a phosphorothioate backbone

 CC The present invention relates to methods for treating or preventing  
 CC cancer, involving administering to a subject having or at risk of  
 CC developing cancer immunostimulatory nucleic acids that induce expression  
 CC of cell surface antigens and antibodies. The methods are useful for  
 CC treating or preventing cancer such as basal cell carcinoma, bladder  
 CC cancer, bone cancer, brain and central nervous system (CNS) cancer,  
 CC breast cancer, cervical cancer, colon and rectum cancer, connective  
 CC tissue cancer, oesophageal cancer, eye cancer, kidney cancer, larynx  
 CC cancer, leukaemia, liver cancer, lung cancer, Hodgkin's lymphoma, non-  
 CC Hodgkin's lymphoma, melanoma, myeloma, oral cavity cancer, ovarian  
 CC cancer, pancreatic cancer, prostate cancer, thabdomyosarcoma, skin  
 CC cancer, stomach cancer, testicular cancer, and uterine cancer. The  
 CC present sequence is an immunostimulatory oligonucleotide described in the  
 CC exemplification of the invention

PT Inserting a nucleic acid into a circular vector comprising joining their
PT ends, melting, and reannealing ends at two different concentrations,
PT useful for cloning small amounts of nucleic acids and forming genomic
PT libraries.

```

XX Example 4; Page 68; 71pp; English.

XX This invention describes a novel method (M1) for inserting a nucleic acid

CC into a circular vector (V1) comprising joining ends of N1 and V1

CC under a first nucleic acid concentration, melting hybridized cohesive

CC circularization ends, and reannealing the ends at a second concentration.

CC The methods are useful for the cloning small amounts of nucleic acids and

CC forming genomic libraries of complex populations of DNA or cDNA. The

CC methods allow the cloning of minute amounts of nucleic acids efficiently

CC and avoids the size selection problems of prior art systems. Larger

CC nucleic acid fragments are just as easily cloned, allowing highly

CC representative libraries to be made. Vector to vector ligation is avoided

CC using the methods. AAA40351-AA0366 represents primers used to illustrate

CC the method of the invention

PT Producing protein or DNA libraries which are useful for improving

PT existing proteins, by in vitro translating protein coding sequences to

PT produce RNA-protein fusions and incubating these protein fusions under

PT high salt conditions.

XX

PS Disclosure; Page 43; 121pp; English.

XX

CC The present sequence is one of a number of oligonucleotides which were

CC used for the generation of RNA-protein fusions, including fusions having

CC a myc epitope tag. The RNA-protein fusions comprise a protein covalently

CC linked to the 3' end of its own mRNA. This is accomplished by synthesis

CC and in vitro or in situ translation of an mRNA molecule with a peptide

CC acceptor attached to its 3' end. The RNA-protein fusions are incubated

CC under high salt conditions to produce a protein library. This method is

CC useful for improving or altering existing proteins, as well as for

CC isolating new proteins and nucleic acid or small molecule targets. It may

CC also be used to improve human or humanised single-chain antibodies for

CC the treatment of a number of diseases. The method is useful for the

CC isolation of proteins with specific binding properties, for screening

CC cDNA libraries and cloning new genes on the basis of protein-protein

CC interactions. Unlike prior art, the new method does not rely on

CC maintaining the integrity of an mRNA:ribosome:nascent chain ternary

CC complex, which is very fragile and is therefore of limited use. The

CC method does not rely on topological links between the protein and the

CC nucleic acid so that the information of the protein is retained and can

CC be recovered in readable, nucleic acid form

 XX Encoding and sorting in vitro translated proteins, useful for the  
 PT identification of desired binding partners, comprises attaching a nucleic  
 PT acid linker to the protein and binding an encoding molecule to the  
 PT linker.  
 XX  
 XX Example 3; Fig 9B; 48pp; English.  
 FS  
 XX

The sequence represents part of a branched encoding molecule used in  
 CC methods to hybridise a capture probe to the addressing element of a DNA  
 CC linker attached to an in vitro translated protein, in order to immobilise  
 CC the protein to a solid support. The new methods are useful for tagging or  
 CC encoding in vitro translated proteins with unique and minimal encoding  
 CC molecules and sorting these molecules onto solid supports. They are also  
 CC useful for the identification of a desired binding partner. The method  
 CC allows the use of pre-made sets of universal encoding molecules, such as  
 CC nucleic acid(s) (analogues). These can be used in conjunction with  
 CC corresponding universal microarrays or sets of microparticles to create  
 CC new protein display systems which are flexible, modular, scalable and  
 CC cost effective. The method allows the use of nucleic acid analogue which

CC are not susceptible to enzymatic incorporation or polymerisation and are  
 CC superior to conventional DNA/RNA. The proteins can also be labelled with  
 CC fluorescent groups which can be used to monitor the protein in real time.  
 CC The absence of RNA is advantageous as they can adopt secondary structures  
 CC which are difficult to predict and can interfere with hybridisation steps  
 CC and protein folding/function

 PT System for detecting immobilized analyte, useful e.g. for biomedical  
 PT diagnosis, has as detection agent specific polypeptide coupled to nucleic  
 PT acid for signal amplification.  
 XX  
 PS Example; Page 6; 12pp; German.  
 XX  
 XX This invention describes a novel test system (A) which comprises at least  
 CC one immobilized analyte (I) on an insoluble carrier and a polypeptide  
 CC detection agent (II), specific for (I) and conjugated, via a linker, to  
 CC an amplifier (III). (A) is used for direct, in vitro detection of (I)  
 CC with amplification of the signal by polymerase chain reaction (PCR), or a  
 CC related technique, applied to (III). The method is useful in biomedical  
 CC diagnosis and environmental monitoring and can be used to detect a wide  
 CC range of (I), e.g. diagnostic or pharmaceutical agents, secondary  
 CC metabolites, herbicides or pesticides. (A) allow simultaneous, parallel  
 CC detection of many different analytes (high throughput capacity),  
 CC relatively simply (only a few incubation and washing steps are required)  
 CC and with high sensitivity and selectivity. This sequence represents  
 CC primer used in the amplification of the c-myc DNA fragment which encodes  
 CC an epitope used to illustrate the method of the invention

PT Typing genes that contain polymorphic microsatellite loci, useful for
PT identifying predisposition to disease, by amplification and determining
PT length of amplicons.
XX
PS Claim 9; Page 50; 64pp; German.
XX
CC The invention describes a method of typing (M1) a gene (I) that has one
CC or more polymorphic microsatellite loci (PML). The method comprises: PCR
CC amplification of at least one DNA region of (I) that includes PML, using
CC as template a DNA sample containing at least one segment of (I); and
CC determining the length of the resulting amplicon(s). Also described are:
CC a method of determining (M2) microsatellite markers (MM) for
CC predisposition to a disease, associated with a gene that includes one or
CC more PML; and prediagnosis (M3) of diseases associated with gene that
CC include PML. The method is used to identify microsatellite markers, in a
CC disease-related gene, that are associated with a predisposition to
CC diseases and for prediagnosis of such diseases, especially prion diseases
CC but also cystic fibrosis, malignant hyperthermia syndrome in pigs and
CC metabolic diseases; also to type genes that encode milk proteins,
CC hormones or transcription factors. The method is simpler, quicker and
CC particularly less expensive than known methods based on sequencing. This
CC sequence represents a prion protein polymorphic microsatellite marker
CC consensus sequence.

XX PT Determining proliferative capacity of cells, useful e.g. for detecting
XX PT tumor cells, by measuring concentration and subcellular localization of
XX PT adenomatous polyposis coli protein.
XX PS Claim 10; Page 13; 26pp; German.
XX CC This invention describes a novel method for determining the proliferative
XX CC activity of cells, comprising detecting, in a sample, the concentration
XX CC and/or subcellular localization of APC (adenomatous polyposis coli)
XX CC protein (I). The invention also describes (I) determining function of (I)
XX CC in a sample by detecting presence of the C-terminal, DNA-binding domain
XX CC of (I); (2) detecting mutations in (I)-encoding nucleic acid by detecting
XX CC the DNA-binding domain of (I); (3) purifying, enriching and/or detecting
XX CC (I) or its fragments by reaction with a probe; (4) double-stranded DNA
XX CC (II) that contains the sequence GCCGCA_2_3G (S1) and/or GATCCT_2_3GC
XX CC (S2); (5) peptide fragment of (I) containing at least the DNA-binding
XX CC domain; (6) antibodies (Ab) directed against an epitope of positions 1340
XX CC -1901, 2219-2580 or 2581-2843 of (I); (7) set of two or more antibodies,
XX CC one of which is Ab and the other directed against the N-terminal region
XX CC (1-1299) of (I); and (8) kit for detecting DNA-binding capacity of (I) or
XX CC its fragments in a sample consisting of (II), Ab or the set of (7). The
XX CC method is used to detect proliferative, especially tumor (precursor),
XX CC cells, to detect function of (I) and mutations in (I), and to purify
XX CC and/or enrich (I), or its fragments, from a sample. The method allows
XX CC simple, rapid and reliable detection of proliferation, without the need
XX CC for polymerase chain reaction or sequencing

XX PT Selective detection of nucleic acids by amplification with labeled
XX PT primers and detection with a trap probe.
XX XX Example 1c; Page 19; 27pp; German.
XX CC This invention describes a novel method for the selective detection of
XX CC nucleic acids which comprises amplification of the nucleic acid with the
XX CC help of labeled primers and detection of a marker probe. The methods and
XX CC reagents are used for the detection of a marker primer and at least 2
XX CC immobilized (or immobilizable) trap probes with the corresponding nucleic
XX CC acid sequence of interest for mutation analysis. The method can be used
XX CC to detect a specific sequence in a sample of one or more nucleic acids by
XX CC using several sets of primers and trap probes (i.e. in an array). The
XX CC methods are useful in molecular biology and diagnostic applications,
XX CC especially for simultaneous detection of multi-pathogens, typing of
XX CC organisms, analyzing genetic diversity and sequencing of genes or
XX CC genomes. This sequence represents a primer used in the method of the
XX CC invention

 PS  
 CC The invention relates to a novel multivalent compound comprising two  
 CC binding groups specific for different binding sites on the same target.  
 CC The compound of the invention demonstrates cytostatic, antirheumatic,  
 CC antiarthritic, antipsoriatic, antidiabetic, ophthalmological,  
 CC antiarteriosclerotic, antiulcer and vasotropic activities and may act as  
 CC an inhibitor of receptor tyrosine kinase activity. The compound may be  
 CC used to prepare diagnostic imaging agents and pharmaceutical compositions  
 CC for treating diseases associated with angiogenesis or hyperproliferation,  
 CC particularly tumours, but also rheumatoid arthritis, psoriasis, diabetic  
 CC retinopathy, atherosclerosis, ulcers and restenosis. Furthermore, the  
 CC compound may be utilised as a contraceptive via inhibition of uterine  
 CC neovascularisation. The current sequence is that of the RT-PCR primer  
 CC oligo dT of the invention which was used to amplify KDR (kinase domain  
 CC region)-related RNA.

 Novel secreted salivary protein, zsig63 and polynucleotide encoding it useful for treating microbial infections, inflammatory conditions, dental caries and lung infections associated with cystic fibrosis.  
 Example 1; Page 29; 33pp; English.  
 The present invention relates to a new secreted salivary protein, zsig63. The invention is useful for detecting in a test sample, the presence of an antagonist or agonist of zsig63 protein activity. The invention is also useful as an immunogen for producing an antibody to zsig63 polypeptide. zsig63-cytokine fusion proteins or antibody-cytokine fusion protein are useful for enhancing in vivo killing of target tissues. Pharmaceutical composition comprising purified zsig63 polypeptide are useful in the treatment of conditions associated with pathological microbes, including bacterial, fungal and viral infections. High expression of zsig63 in salivary gland suggests that anti-microbial polypeptides are useful for treatment of dental caries (tooth decay), periodontal disease, thrush and gastrointestinal disease. Other applications can be used in urinary tract infections, vaginal infections, prevention of infection in skin and other epithelial wounds. The polypeptides can be used to establish normal microflora and protect against pathogenic colonisation and invasion. The invention is useful when pro-inflammatory activity is desired. Applications for such pro-inflammatory activity include the treatment of chronic tissue damage, particularly in areas having a limited or damaged vascular system e.g., damage in extremities associated with diabetes. Antagonists to zsig63 polypeptides may be useful as anti-inflammatory agents. The invention is useful for the treatment of patients having incompetent immune system, such as AIDS (acquired immunodeficiency syndrome) patients or individuals that have undergone chemotherapy, radiation treatment. The invention is also useful for the treatment of lung infections associated with cystic fibrosis and its agonists or antagonists are useful for aiding digestion. The present nucleic acid sequence represents a PCR primer that was used in the methods of the invention for identification of zsig63

PT Novel secreted salivary polypeptide, zsig63, useful as antimicrobial agent for treating microbial infection, dental caries, periodontal disease, thrush gastrointestinal disease, and for aiding digestion.

PT

XX Example 1; Page 29; 33pp; English.

PS

XX The invention relates to human secreted salivary polypeptide designated as zsig63 and nucleic acid molecules encoding such polypeptides. zsig63 can be used in detecting agonists and antagonists of its activity, and is also useful as a host defense polypeptide, immune modulating factor, antipathogenic polypeptide, cell-cell signalling molecule, growth factor, cytokine, or as secreted extracellular matrix associated proteins with growth factor hormone activity. It is useful for treating conditions associated with pathological microbes, including bacterial, fungal and viral infections, for treating dental caries (tooth decay), periodontal disease, thrush and gastrointestinal disease, for treating urinary tract infection, vaginal infection and for preventing infection in skin and other epithelial wounds. zsig63 is useful for establishing normal microflora and protect against pathogenic colonisation and invasion, for treating chronic tissue damage e.g. damage in extremities associated with diabetes and useful as anti-inflammatory agents. It is useful as a marker of lung dysfunction, salivary gland dysfunction, or dysfunction of prostate gland. It is also therapeutically useful for aiding digestion. Polynucleotides of the invention are used in gene therapy for increasing or inhibiting zsig63 activity, for detecting abnormalities on human chromosome 4 associated with disease or other human traits and as

CC diagnostics in forensic DNA profiling. Sequences of the invention are  
CC useful for stimulating proliferation or differentiation of cardiac  
CC myocytes, for proliferation or differentiation of adipocytes and for  
CC inhibiting chondrosarcomas, atherosclerosis, restenosis and obesity. The  
CC present sequence is a primer used in the identification of human zsig63  
CC DNA

PT Novel isolated zsig63 polypeptide, member of the adhesin family, useful  
PT for treating dental carries, periodontal disease, thrush,  
PT gastrointestinal disease, urinary tract infections, vaginal infections,  
PT skin infections.  
XX  
PS Example 1; Page 29; 32pp; English.  
XX  
CC The invention relates to an isolated zsig63 polypeptide comprising at  
CC least 90% identity to an amino acid sequence which comprises domain 1 of  
CC zsig63, domain 2, domain 3, mature zsig63 and full length zsig3. Also  
CC included are the polynucleotide encoding zsig63, a zsig63 expression  
CC vector, a cultured cell comprising the vector and expressing the protein,  
CC a DNA encoding a fusion protein (comprising amino acids 1-15, 16-37, 39-  
CC 126, 127-219 or 16-219 of zsig63 and an additional protein), using a  
CC zsig63 reporter gene construct to identify zsig63 agonists, and producing  
CC an anti-zsig63 antibody using zsig63 immunogenic peptides, zsig63 is  
CC useful for detecting in a test sample, the presence of antagonist of

CC zsig63 protein activity. Zsig63 has antimicrobial activity and since  
CC exhibits high expression in salivary gland, can be used for treating  
CC dental carries, periodontal disease, thrush, and gastrointestinal  
CC disease, urinary tract infections, vaginal infections, skin infections  
CC and epithelial wounds. The polypeptides can be used to establish  
CC normal microflora and protect against pathogenic colonization and  
CC invasion. Zsig63 can also be used for providing pro-inflammatory activity  
CC for treating chronic, tissue damage particularly in areas having limited  
CC or damaged vascular system, e.g. in diabetes, and for treating  
CC immunocompromised AIDS patients or in individuals that have undergone  
CC chemotherapy, radiation treatment, for treating lung infections e.g. in  
CC cystic fibrosis. Detection of zsig63 polypeptide at relatively high  
CC levels in the trachea may indicate that such polypeptides may serve as a  
CC marker of lung dysfunction. Zsig63 is also useful in diagnosing  
CC conditions associated with salivary gland or lung dysfunction including  
CC salivary gland carcinoma, pneumocystis carinii infection, emphysema,  
CC chronic bronchitis, prostate dysfunction, and as components of defined cell  
CC adenocarcinoma, aiding digestion, and as components of defined cell  
CC culture media and may be used to replace serum that is commonly used in  
CC culture. The DNA is useful in gene therapy applications to increase or  
CC inhibit zsig63 activity, and for detecting abnormalities on human  
CC chromosome 4 (e.g. 4q12-4q13, associated with dentinogenesis imperfecta,  
CC and dentin dysplasia type II). Zsig63 is an adhesin family member. The  
CC present sequence is a primer used to isolate and sequence nucleic acids  
CC encoding human zsig63

 XX Transgenic mammal or its embryo useful as model for human disease, has  
 PT heterologous nucleotide sequence coding for stratum corneum chymotryptic  
 PT enzyme operably linked to promoter that drives its expression in skin.  
 XX  
 PS Example 6; Page 36; 74pp; English.

CC This invention describes a novel non-human transgenic mammal or mammalian  
 CC embryo having integrated within its genome, a heterologous nucleotide  
 CC sequence comprising at least a significant part of a nucleotide sequence  
 CC coding for a stratum corneum chymotryptic enzyme (SCCE) or its variant,  
 CC operably linked to a promoter that drives expression of heterologous scce  
 CC or its variant in skin. The product of the invention is useful as a model  
 CC for the study of disease with the aim of improving treatment, to relieve  
 CC or ameliorate a pathogenic condition, for development or testing of a  
 CC cosmetic or a pharmaceutical formulation, and for the development of a  
 CC diagnostic method. It can also be used as a model for a skin disease or  
 CC skin cancer. The invention is also useful for screening or identifying a  
 CC compound or composition effective for the prevention or treatment of an  
 CC abnormal or unwanted phenotype, and for screening or identifying a  
 CC compound or composition effective for the prevention or treatment of  
 CC inflammatory skin diseases selected from diseases consisting of epidermal  
 CC hyperkeratosis, acanthosis, epidermal inflammation, dermal inflammation,  
 CC pruritus, atopic dermatitis, eczema, acne and inherited skin diseases,  
 CC with epidermal hyperkeratosis. The mammal of the invention is also useful  
 CC as a model for further studies of itch mechanisms and the testing of  
 CC potential compounds and compositions for relieve of various skin diseases  
 CC where itch is a component. This sequence represents a 5' RACE cDNA  
 CC synthesis primer used in a method of detecting homologues to human  
 CC stratum corneum chymotryptic enzyme, SCCE, gene. SCCE is a serine  
 CC protease synonymous with human kallikrein 7 (KLK7) and is used in the  
 CC development of the transgenic mammals described in the invention

XX Reagent for rapidly detecting or isolating target nucleic acid sequences
PT in polynucleotide-containing sample, comprises capture component and
PT target-specific probe linked to solid substrate.
XX Example 3; Col 17; 24pp; English.
XX The present invention describes a rapid pairing reagent (I) for the
CC isolation or detection of a polynucleotide (PN) analyte molecule having a
CC selected target base sequence, in a sample containing the analyte
CC molecule and non-target polynucleotide, comprising a capture component
CC (A) and a target-specific probe (B) linked to a solid substrate. The
CC isolated sequences are useful for enzymatic amplification. (I) is capable
CC of rapidly binding nucleic acids in the sample and placing them in close
CC proximity to target probes on the reagent, thus enabling binding under
CC low stringency. Combination of rapid capture and concentration of
CC polynucleotides with selective targeting of analyte molecules, greatly
CC enhances the isolation process. Non-ionic morpholino oligomers used as
CC probes are not extended by polymerases and therefore do not interfere
CC with amplification of target molecule. AAA39306 to AAA39316 represent
CC oligonucleotides used in the exemplification of the present invention

XX
CC The present sequence represents a capture probe specific for a c-myc
CC fusion target. It is used in the method of the invention. The
CC specification describes the use of non-nucleoside spacers to immobilise
```

```
CC an array of capture probes on a solid support. The solid support carries
CC an array of capture probes, each consisting of non-nucleoside spacers
CC plus an oligonucleotide to which a nucleic acid-protein fusion or a
CC ribosome display particle is bound. Non-nucleoside spacers prevent
CC interaction of proteins with the support surface, ensuring efficient
CC hybridisation between capture probes and bound nucleic acid/protein
CC fusions, while minimising denaturation of the protein which may then
CC adopt its native folded structure. The arrays of capture probes are used
CC to screen for interactions between proteins and compounds (e.g. other
CC proteins, ligands or nucleic acids), particularly to identify potential
CC therapeutic agents, enzyme substrates or unknown proteins that interact
CC with drugs, but also for diagnosis (detecting disease-associated
CC proteins) and for quantifying target molecules in a sample

PT Preparation of controlled pore glass-polytetrafluoroethylene resin
PT chromatography membrane by heating, calendaring and sintering mixture of
PT controlled pore glass and aqueous dispersion of polytetrafluoroethylene.
XX
PS Example 12; Col 8; 6pp; English.
XX
CC The invention relates to a method of preparing a controlled pore glass-
CC polytetrafluoroethylene (PTFE) resin chromatography membrane, comprising
CC combining controlled pore glass and an aqueous dispersion of PTFE to form
CC a paste-like mass, heating the paste-like mass at 50-70 plus °C,
CC calendaring to form a foldable sheet, and sintering the sheet to produce
CC a rigid, porous sheet. The method prepares a controlled pore glass-PTFE
CC resin chromatography membrane for use in various biotechnical procedures.
CC The membrane is useful in place of controlled pore glass as a support for
CC the synthesis, isolation, and purification of nucleic acids and for the
CC isolation and purification of proteins. The method produces a membrane
CC that may be used in lieu of controlled pore glass. The present sequence
CC represents an oligonucleotide prepared on the membrane in an example
CC which demonstrates the method of the invention

XX PT Producing sub-population of labeled nucleic acids, useful for analyzing
XX differences in RNA profiles between several different physiological
XX sources, using set of distinct gene specific primers.
XX Example 3; SEQ ID NO 748; 11pp; English.
XX The invention relates to producing a sub-population of labeled nucleic
XX acids (NAs) comprising contacting a NA sample from a physiological
XX source, with a pool of 50 distinct gene specific primers under suitable
XX conditions to enzymatically generate sub-population of NAs, where each
XX gene specific primer has a sequence complementary to a distinct mRNA, and
XX each labeled NA is generated using a single gene specific primer. The
XX method is useful for producing a sub-population of labeled NAs which is
XX useful for analysing the differences in the RNA profiles between several
XX different physiological sources, where the method comprises producing
XX subpopulation of labeled NAs for the different physiological sources,
XX comprising the populations for each physiological source to identify
XX differences in the population, where the comparison is preferably
XX performed by hybridising the labeled NAs for each of the distinct
XX physiological sources to an array of probe NAs stably associated with the
XX surface of a substrate to produce a hybridisation pattern for each of the
XX sources, and comparing the patterns for each of the sources, where
XX differential gene expression assays are utilised in differential
XX expression analysis of diseased or normal tissue e.g. neoplastic a normal
XX tissue, or different tissue or sub tissue types. The present sequence is a
XX human gene specific PCR primer used in the method of the invention. Note:
XX The sequence data for this patent did not form part of the printed
XX specification, but was obtained in electronic format directly from USPTO
XX at http.wipo.seqdata.uspto.gov/sequence.html?docID=6352829B1

PS Disclosure; SEQ ID NO 1329; 350pp; English.
XX
CC The invention relate to a method of diagnosing (M1) non-blood disease
CC such as solid tumor by providing peripheral blood sample of human having
CC non-blood disease, and comparing an expression profile of specific genes
CC in the peripheral blood sample to reference expression profile of the
CC genes, where each of the genes is differentially expressed in peripheral
CC blood mononuclear cells (PBMCs) of patients having the disease as
CC compared to PBMCs of normal humans. The method is useful for diagnosing
CC non-blood disease such as solid tumor. The solid tumor is chosen from
CC renal cell carcinoma (RCC), prostate cancer and head/neck cancer. The
CC peripheral blood sample comprises enriched PBMCs. The peripheral blood
CC sample is a whole blood sample (claimed). (M1) is useful for identifying
CC genes that are differentially expressed in peripheral blood samples
CC isolated at different stages of progression, development or treatment of
CC RCC and/or other solid tumors. This sequence corresponds to a probe to
CC detect a gene that is differentially expressed and detected by the method
CC of the invention.

XX CC The invention relate to a method of diagnosing (M1) non-blood disease
CC such as solid tumor by providing peripheral blood sample of human having
CC non-blood disease, and comparing an expression profile of specific genes
CC in the peripheral blood sample to reference expression profile of the
CC genes, where each of the genes is differentially expressed in peripheral
CC blood mononuclear cells (PBMCs) of patients having the disease as
CC compared to PBMCs of normal humans. The method is useful for diagnosing
CC non-blood disease such as solid tumor. The solid tumor is chosen from
CC renal cell carcinoma (RCC), prostate cancer and head/neck cancer. The
CC peripheral blood sample comprises enriched PBMCs. The peripheral blood
CC sample is a whole blood sample (claimed). (M1) is useful for identifying
CC genes that are differentially expressed in peripheral blood samples
CC isolated at different stages of progression, development or treatment of
CC RCC and/or other solid tumors. This sequence corresponds to a probe to
CC detect a gene that is differentially expressed and detected by the method
CC of the invention.

XX PT Novel human phosphodiesterase polypeptide, zcytor13 and polynucleotide encoding it, for detecting human chromosomal abnormalities, identifying modulators and treating inflammatory and cardiovascular diseases.  
XX PS Example 1C; Page 118; 122pp; English.  
XX CC The patent discloses novel human phosphodiesterase (PDE), zcytor13 cDNA and its corresponding protein. Zcytor13 protein is used to promote wound healing in tissues, to inhibit anti-bacterial and anti-viral effects and to identify modulators (e.g. agonists or antagonists). Zcytor13, its agonists or antagonists are useful in the treatment of inflammatory heart or cardiovascular conditions, muscle inflammation, inflammation during and after surgery, arthritis, asthma, inflammatory bowel disease or diverticulitis, for modulating spermatogenesis, sperm capacitation, as immunosuppressive or anti-fertility vaccine and for treating male infertility. Zcytor13 protein and its antibodies are used to diagnose cancer, reperfusion ischaemia, asthma, psoriasis and melanoma. Zcytor13 proteins are used to enhance fertilisation. Zcytor13 antagonists are used to treat myocarditis, atherosclerosis, pelvic inflammatory disease (PID), psoriasis, eczema, scleroderma and other inflammatory diseases. Zcytor13 sequences and/or its antibodies are useful for treatment of disorders

CC associated with vasoconstriction, heart arrhythmia, congestive heart disease, muscle spasms and fatigue. They are used for detecting human chromosomal abnormalities. Zcytor13 cDNAs are used in gene therapy. CC Zcytor13-cytokine fusion proteins or antibody-cytokine fusion proteins are useful for enhancing in vivo killing of target tissue. The present sequence is a polyA PCR primer, ZC7764b which is used to isolate full length zcytor13 cDNA by screening human placental cDNA library

 XX  
 XX The present invention relates to a new secreted salivary protein, zsig63.  
 CC The invention is useful for detecting in a test sample, the presence of  
 CC an antagonist or agonist of zsig63 protein activity. The invention is  
 CC also useful as an immunogen for producing an antibody to zsig63.  
 CC polypeptide. zsig63-cytokine fusion proteins or antibody-cytokine fusion  
 CC protein are useful for enhancing in vivo killing of target tissues.  
 CC Pharmaceutical composition comprising purified zsig63 polypeptide are  
 CC useful in the treatment of conditions associated with pathological  
 CC microbes, including bacterial, fungal and viral infections. High  
 CC expression of zsig63 in salivary gland suggests that anti-microbial  
 CC polypeptides are useful for treatment of dental caries (tooth decay),  
 CC periodontal disease, thrush and gastrointestinal disease. Other  
 CC applications can be used in urinary tract infections, vaginal infections,  
 CC prevention of infection in skin and other epithelial wounds. The  
 CC polypeptides can be used to establish normal microflora and protect  
 CC against pathogenic colonisation and invasion. The invention is useful  
 CC when pro-inflammatory activity is desired. Applications for such pro-  
 CC inflammatory activity include the treatment of chronic tissue damage,  
 CC particularly in areas having a limited or damaged vascular system e.g.,  
 CC damage in extremities associated with diabetes. Antagonists to zsig63  
 CC polypeptides may be useful as anti-inflammatory agents. The invention is

CC useful for the treatment of patients having incompetent immune system,  
 CC such as AIDS (acquired immunodeficiency syndrome) patients or individuals  
 CC that have undergone chemotherapy, radiation treatment. The invention is  
 CC also useful for the treatment of lung infections associated with cystic  
 CC fibrosis and its agonists or antagonists are useful for aiding digestion.  
 CC The present nucleic acid sequence represents a PCR primer that was used  
 CC in the methods of the invention for identification of zsig63

 XX  
 XX The invention relates to human secreted salivary polypeptide designated  
 CC as zsig63 and nucleic acid molecules encoding such polypeptides. zsig63  
 CC can be used in detecting agonists and antagonists of its activity, and is  
 CC also useful as a host defense polypeptide, immune modulating factor,  
 CC antipathogenic polypeptide, cell-cell signalling molecule, growth factor,  
 CC cytokine, or as secreted extracellular matrix associated proteins with  
 CC growth factor hormone activity. It is useful for treating conditions  
 CC associated with pathological microbes, including bacterial, fungal and  
 CC viral infections, for treating dental caries (tooth decay), periodontal  
 CC disease, thrush and gastrointestinal disease, for treating urinary tract  
 CC infection, vaginal infection and for preventing infection in skin and

CC other epithelial wounds. zsig63 is useful for establishing normal  
 CC microflora and protect against pathogenic colonisation and invasion, for  
 CC treating chronic tissue damage e.g. damage in extremities associated with  
 CC diabetes and useful as anti-inflammatory agents. It is useful as a marker  
 CC of lung dysfunction, salivary gland dysfunction, or dysfunction of  
 CC prostate gland. It is also therapeutically useful for aiding digestion.  
 CC Polynucleotides of the invention are used in gene therapy for increasing  
 CC or inhibiting zsig63 activity, for detecting abnormalities on human  
 CC chromosome 4 associated with disease or other human traits and as  
 CC diagnostic in forensic DNA profiling. Sequences of the invention are  
 CC useful for stimulating proliferation or differentiation of cardiac  
 CC myocytes, for proliferation or differentiation of adipocytes and for  
 CC inhibiting chondrosarcomas, atherosclerosis, restenosis and obesity. The  
 CC present sequence is a primer used in the identification of human zsig63  
 CC DNA

XX New zalphall ligand polypeptides and polynucleotides, useful for  
 PT stimulating proliferation, activation, differentiation and/or induction  
 PT of inhibition of specialized cell function, or for stimulating an  
 PT antigenic response.  
 XX  
 PS Example 7; Col 139; 105pp; English.

XX The present invention relates to the isolation of a novel cytokine,  
 CC zalphall Ligand and the polynucleotide encoding it. The invention also  
 CC gives the sequence for the zalphall receptor and the polynucleotide  
 CC encoding it. The zalphall Ligand polypeptide stimulates proliferation of  
 CC natural killer (NK) cells or NK cell progenitors, the activation of NK

CC cells, proliferation of T-cells, proliferation of B-cells stimulated with  
 CC anti-CD40 antibodies, stimulates an antigenic response in a mammal, and  
 CC reduces proliferation of B-cells stimulated with anti-IGM antibodies. The  
 CC zalphall Ligand polypeptide is also useful in preparing antibodies that  
 CC bind to zalphall Ligand epitopes. The zalphall Ligand polynucleotides can  
 CC be used as probes or primers to clone regions of a zalphall Ligand gene,  
 CC and in gene therapy. Zalphall Ligand may also be used to identify  
 CC inhibitors of its activity, to enhance the generation of anti-tumour  
 CC responses with or without the infusion of donor lymphocytes, and to  
 CC activate or stimulate the immune system. The present sequence represents  
 CC a sequencing primer used to sequence cDNA clones in the isolation of  
 CC human zalphall Ligand

XX Novel isolated zsig63 polypeptide, member of the adhesion family, useful  
 PT for treating dental carries, periodontal disease, thrush,  
 PT gastrointestinal disease, urinary tract infections, vaginal infections,  
 PT skin infections.

XX Example 1; Page 29; 32pp; English.

XX The invention relates to an isolated zsig63 polypeptide comprising at  
 CC least 90% identity to an amino acid sequence which comprises domain 1 of  
 CC zsig63, domain 2, domain 3, mature zsig63 and full length zsig3. Also  
 CC included are the polynucleotide encoding zsig63, a zsig63 expression

vector, a cultured cell comprising the vector and expressing the protein, a DNA encoding a fusion protein (comprising amino acids 1-15, 16-37, 38-126, 127-219 or 16-219 of zsi963 and an additional protein), using a zsi963 reporter gene construct to identify zsi963 agonists, and producing an anti-zsi963 antibody using zsi963 immunogenic peptides, and producing useful for detecting in a test sample, the presence of antagonist of zsi963 protein activity. Zsi963 has antimicrobial activity and since exhibits high expression in salivary gland, can be used for treating dental caries, periodontal disease, thrush, and gastrointestinal disease, urinary tract infections, vaginal infections, and skin infections and other epithelial wounds. The polypeptides can be used to establish normal microflora and protect against pathogenic colonization and invasion. Zsi963 can also be used for providing pro-inflammatory activity for treating chronic, tissue damage particularly in areas having limited or damaged vascular system, e.g. in diabetes, and for treating immunocompromised AIDS patients or in individuals that have undergone chemotherapy, radiation treatment, for treating lung infections e.g. in cystic fibrosis. Detection of zsi963 polypeptide at relatively high levels in the trachea may indicate that such polypeptides may serve as a marker of lung dysfunction. Zsi963 is also useful in diagnosing conditions associated with salivary gland or lung dysfunction, including salivary gland carcinoma, Pneumocystis carinii infection, emphysema, chronic bronchitis, prostate dysfunctions such as prostate adenocarcinoma, aiding digestion, and as components of defined cell culture media and may be used to replace serum that is commonly used in culture. The DNA is useful in gene therapy applications to increase or inhibit zsi963 activity, and for detecting abnormalities on human chromosome 4 (e.g. 4q12-4q13, associated with dentinogenesis imperfecta, and dentin dysplasia type II). Zsi963 is an adhesin family member. The present sequence is a primer used to isolate and sequence nucleic acids encoding human zsi963

XX PT Stimulating an immune response in a mammal exposed to an antigen or pathogen, useful for enhancing anti-tumor activity resulting in reduced tumor progression or metastasis, comprises administering zalphall1 ligand polypeptide.

XX PS Example 7; SEQ ID NO 38; 103pp; English.

XX CC The invention relates to stimulating an immune response in a mammal exposed to an antigen or pathogen comprising administering a composition comprising mature zalphall1 ligand polypeptide comprising residues 32-162 of ADH44572 in a pharmaceutical vehicle. Also included are stimulating an immune response in a mammal exposed to an antigen or pathogen (comprising: (a) determining (in)directly the level of antigen or pathogen present in the mammal; (b) administering a composition comprising zalphall1 ligand polypeptide in a pharmaceutical vehicle; (c) determining (in)directly the level of antigen or pathogen in the mammal; and (d) comparing the antigen or pathogen level in (a) with (b), where a change in the level indicates stimulation of immune response), and stimulating an immune response in a mammal exposed to an antigen or pathogen (comprising: (a) determining a level of antigen- or pathogen-specific antibody; (b) administering a composition comprising zalphall1 ligand polypeptide in a pharmaceutical vehicle; (c) determining administration level of the antigen- or pathogen-specific antibody; and (d) comparing the level of the antibody in (a) with (b), where an increase in the antibody level indicates stimulation of immune response). The method is useful for stimulating an immune response in a mammal exposed to an antigen or pathogen, and for enhancing anti-tumour activity resulting in a reduction in tumour progression, decrease in metastasis, or tumour stasis. The tumour may be a haematopoietic tumour, a lymphoma or a B cell tumour. The zalphall1 ligand is useful for treating a wide range of diseases arising from defects in the immune system, e.g. systemic lupus erythematosus, rheumatoid arthritis, myasthenia gravis, or diabetes, for boosting immunity to infectious diseases, treating immunocompromised patients, such as HIV+ patients and in improving vaccines. The present sequence is a sequencing primer used in the exemplification of the invention.

```

```
XX The invention describes an isolated polypeptide comprising a sequence of
CC amino acid residues that is at least 90 or 95% identical to residues 41
CC (Gln) to 148 (Ile), or 32 (Gln) to 148 (Ile) of a sequence of 162 amino
CC acids (SEQ ID NO:2, human zalphall1 ligand), fully defined in the
CC specification. Also described are: a pharmaceutical composition
CC comprising the polypeptide, and a vehicle; a method of treating cancer in
CC a mammal; a method of stimulating an immune response in a mammal with
CC melanoma; a method of stimulating an immune response in a mammal bearing
CC a tumour; an isolated polynucleotide comprising a sequence of nucleotides
CC that encode amino acid residues cited above, where the polynucleotide
CC encodes a polypeptide that binds a receptor comprising 538 amino acids,
CC fully defined in the specification; a pharmaceutical composition
CC comprising the polynucleotide encoding, in a pharmaceutically acceptable
CC vehicle; an expression vector comprising the following operably linked
CC elements a control element; and a DNA segment comprising the
CC polynucleotide; and an isolated polynucleotide molecule comprising at
CC least 10 nucleotides of the polynucleotide sequence of 642 bp, fully
CC defined in the specification. The molecules, compositions and methods are
CC useful for treating cancer, e.g. melanoma, solid tumour, haematopoietic
CC tumour, or lymphoma. This sequence represents a primer used in the
CC expression cloning of human cytokine zalphall1 ligand.

 XX Analyzing repeat sequences in DNA using a probe which hybridizes to  
 PT adjacent repetitive and non-repetitive regions and determining hybrid  
 PT melting point is useful to detect microsatellite instability such as in  
 PT hereditary cancer.  
 XX Claim 16; Page 7; 19pp; English.  
 PS The present invention relates to a method for analysing a target nucleic  
 CC acid consisting of repetitive and non-repetitive sequences. The method  
 CC comprises hybridising a polynucleotide probe comprising a segment  
 CC complementary to a non-repetitive region and a segment complementary to  
 CC an adjacent repetitive region, where the second segment consists of a  
 CC defined number of repeats, and determining the melting point temperature  
 CC of the hybrid. The method is used to analyse microsatellites, especially  
 CC microsatellite instability, particularly as a means for detecting  
 CC hereditary tumours. Alternatively, the method is used to identify an  
 CC individual in a population. The present sequence is a probe for  
 CC Mononucleotide repeat locus BAT25, and was used to illustrate the  
 CC invention

XX
XX Synthesis of branched polymers and novel branched polymeric structures -
PT used as molecular probes esp. for detecting poly-nucleotide(s).
XX
XX Example 8; Page 33; 52pp; English.
XX
XX The sequences given in AAQ83938, AAQ83952 and AAQ83940 are used in the
CC construction of an oligonucleotide clamp. The clamp is a comb-type
CC branched polymer which has 3' termini and was used to bind a target
CC sequence comprising a segment of the HIV pol and nef genes in single
CC stranded or double stranded forms. An oligonucleotide clamp is a compound
CC capable of forming a covalently closed macromolecule or a stable circular
CC complex after specifically binding to the target polynucleotide.
CC Oligonucleotide clamps generally comprise one or more oligonucleotide
CC moieties capable of specific binding to the target molecule and one or
CC more pairs of binding moieties covalently linked to the oligonucleotide
CC moieties. Upon annealing of the oligonucleotides moieties to the target
CC polynucleotide, the binding moieties of a pair are brought into
CC juxtaposition so that they form a stable covalent or non-covalent linkage
CC or complex. The interaction of the binding moieties effectively clamps
CC the specifically annealed oligonucleotide moieties to the target
CC polynucleotide. (Updated on 25-MAR-2003 to correct PN field.)

XX  Jarvik JW;
PI  WPI; 2001-514778/56.
XX
XX  Transcript, genetic, and especially nucleic acid sequence analysis
XX  comprises analysis of hybrid peptide products.
XX
XX  Example 11; Page 30; 48pp; English.
XX
XX  The invention relates to a method of peptide-based transcript or genetic
XX  analysis comprising: (a) providing multiple polynucleotides (I) derived
XX  from mRNAs from a biological sample, where (I) has homology to a known
XX  reference sequence (II); (b) expressing (I); and (c) assessing a physical
XX  property of the expression products to determine the sequences of (I) by
XX  comparison with the predicted properties of polypeptides encoded by (II).
XX  The method is useful for transcript or genetic analysis, especially
XX  nucleic acid analysis where the method comprises expressing polypeptides
XX  from two or more reading frames and determining the masses to create a
XX  peptide mass signature characteristic of the nucleic acid molecule. The
XX  peptide is considerably smaller than the DNA molecule that encodes it
XX  (individual amino acids averages about 110 Daltons each whereas the
XX  trinucleotides (triplets) that encode them average N Daltons each). Also,
XX  the peptides are much more diverse in composition than nucleic acids, as
XX  they are composed of combinations of 20 different amino acids instead of
XX  combinations of 4 different nucleotides, e.g., two random DNA fragments
XX  of identical composition (e.g., with 10 adenines, 10 thymines, 15
XX  guanines, and 15 cytosines) are extremely unlikely to encode peptides of
XX  identical composition. This means that whereas the two nucleic acids have
XX  identical masses and cannot be distinguished on the basis of mass, the
XX  peptides that they encode will, except in statistically very rare cases,
XX  have different masses and can be readily distinguished in the basis of
XX  mass. The present sequence represents the coding sequence of human
XX  haemoglobin alpha 2 transcript (extreme 3' end) used in an example to
XX  demonstrate the method of the invention

XX
XX  Determining proliferative capacity of cells, useful e.g. for detecting
XX  tumor cells, by measuring concentration and subcellular localization of
XX  adenomatous polyposis coli protein.
XX
XX  Claim 10; Page 12; 26pp; German.
XX
XX  This invention describes a novel method for determining the proliferative
XX  activity of cells, comprising detecting, in a sample, the concentration
XX  and/or subcellular localization of APC (adenomatous polyposis coli)
XX  protein (I). The invention also describes (1) determining function of (I)
XX  in a sample by detecting presence of the C-terminal, DNA-binding domain
XX  of (I); (2) detecting mutations in (I)-encoding nucleic acid by detecting
XX  the DNA-binding domain of (I); (3) purifying, enriching and/or detecting
XX  (I) or its fragments by reaction with a probe; (4) double-stranded DNA
XX  (S2); (5) peptide fragment of (I) containing at least the DNA-binding
XX  domain; (6) antibodies (Ab) directed against an epitope of positions 1340
XX  -1901, 2219-2580 or 2581-2843 of (I); (7) set of two or more antibodies,
XX  one of which is Ab and the other directed against the N-terminal region
XX  (1-1299) of (I); and (8) kit for detecting DNA-binding capacity of (I) or
XX  its fragments in a sample consisting of (II), Ab or the set of (7). The
XX  method is used to detect proliferative, especially tumor (precursor),
XX  cells, to detect function of (I) and mutations in (I), and to purify
XX  and/or enrich (I), or its fragments, from a sample. The method allows
XX  simple, rapid and reliable detection of proliferation, without the need
XX  for polymerase chain reaction or sequencing

XX Identifying a candidate polymorphic repeat within a coding sequence, for  
 PT understanding or treating genetic disease, comprises detecting tandem  
 PT repeats in a target coding sequence and scoring the repeats for  
 PT polymorphic probability.

XX Example; Col 717; 588pp; English.

XX The invention discloses a method for identifying a candidate polymorphic  
 CC repeat within a coding sequence (expressed sequence tag, EST), which  
 CC comprises detecting tandem repeats in a target coding sequence, scoring  
 CC the repeats for polymorphic probability and generating a dataset  
 CC correlating the repeats with polymorphic probability to identify a  
 CC candidate polymorphic repeat. The computational methods (polymorphic  
 CC marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are  
 CC useful for identifying and detecting candidate polymorphic repeats in  
 CC human genes, which can be used to understand, treat or eliminate genetic  
 CC diseases, predispositions or adverse drug-treatment reactions. Examples  
 CC of diseases linked to nucleotide repeats are Machado-Joseph, Haw River  
 CC syndrome, Huntington's disease, fragile-X syndrome, Friedreich's ataxia,  
 CC myotonic dystrophy, hyperandrogenemia, spinal and bulbar atrophy and  
 CC spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are  
 CC the polymorphic repeats identified for a search of human ESTs

PT Detecting an analyte in a sample comprises providing nucleic acid

PT sequence which is catalytically active in presence of analyte, contacting  
 PT catalytic nucleic acid with substrate and amplifying catalytic product.

PS Disclosure; Page; 36pp; English.

XX The invention relates to a method of detecting an analyte in a sample.  
 CC The method comprises providing a nucleic acid sequence which is initially  
 CC catalytically inactive, but which becomes catalytically active in the  
 CC presence of an analyte (the effector); providing a nucleic acid substrate  
 CC for the catalytic activity of the nucleic acid sequence; and contacting  
 CC the nucleic acid sequence and the substrate with the sample under  
 CC conditions allowing catalytic activity of nucleic acid sequences. The  
 CC catalytic nucleic acid sequence will be able to convert the nucleic acid  
 CC substrate into a nucleic acid product only if the analyte of interest is  
 CC present. The nucleic acid catalytic product is then amplified, and a  
 CC significant increase in the amount of product indicates the presence of  
 CC the analyte in the sample. The method is useful for the qualitative or  
 CC quantitative determination of an analyte in a sample in diagnostic  
 CC assays. The invention describes the in vitro selection of a ribozyme  
 CC ligase (L1; AAA57859, AAA57860) which is catalytically active only in the  
 CC presence of an oligonucleotide effector (AAA57854). The L1 ribozyme  
 CC ligase was selected from a pool of RNA molecules comprising a central  
 CC randomised region 90 nucleotides in length flanked on both sides by  
 CC constant sequence regions (the N90 RNA pool; AAA57851). In the presence  
 CC of the effector, selection was performed using one of the tagged  
 CC substrate molecules AAA57855-A57857. RNAs with ligase activity (i.e.,  
 CC those which have become ligated to the substrate molecule) were reverse  
 CC transcribed using the effector oligo, and then PCR amplified using the  
 CC effector and a DNA primer identical in sequence to the substrate used for  
 CC the selection. A ribozyme ligase, L1, was selected via this procedure. L1  
 CC can only adopt its active conformation (AAA57859) in the presence of the  
 CC effector oligo (analyte). In the absence of the effector, L1 adopts an  
 CC inactive conformation (AAA57860). The present sequence represents the  
 CC deoxy-T22-tagged substrate oligonucleotide. The dr22 tag enables  
 CC successfully ligated products to be isolated using oligo(dA) cellulose  
 CC Type 7. Note: The present sequence is not given in the specification, but  
 CC is created from the information given on page 11

 XX  
 CC The invention relates to human and mouse G protein-coupled receptors  
 CC (GPCRs) and nucleic acids encoding them. The invention also relates to  
 CC sequences at least 90% identical to the GPCR proteins and nucleic acids  
 CC of the invention; methods of treating, preventing or diagnosing diseases  
 CC associated with GPCRs of the invention; methods of screening for  
 CC compounds useful in the treatment of GPCR-related diseases; a transgenic  
 CC mouse comprising a GPCR gene of the invention; a mouse comprising a  
 CC mutation in a GPCR transgene or in an endogenous GPCR gene; cells derived  
 CC from the transgenic mice; kits comprising several mice, each of which has  
 CC a mutation in a different GPCR gene of the invention; and kits comprising  
 CC probes which hybridise to GPCR polynucleotides of the invention. The  
 CC invention further discloses variants of the GPCR polypeptides and vectors  
 CC comprising a GPCR nucleic acid. The GPCR nucleic acids and proteins may  
 CC be used in the diagnosis, treatment or prevention of a wide variety of  
 CC diseases including neurological disorders (e.g., Alzheimer's disease,  
 CC depression, diabetic neuropathy, Parkinson's disease or schizophrenia);  
 CC disorders of the adrenal gland; disorders of the colon or intestine  
 CC (e.g., Crohn's disease, diarrhoea, food poisoning or irritable bowel  
 CC syndrome); cardiovascular disorders (e.g., angina, cardiac arrhythmia or  
 CC myocardial infarction); muscular disorders; blood disorders (e.g.,  
 CC anaemia or leukaemia); immune disorders (e.g., autoimmune disorders or  
 CC AIDS); bone and joint disorders (e.g., osteoarthritis, rheumatoid  
 CC arthritis, gout or osteoporosis); metabolic or nutritive disorders (e.g.,  
 CC obesity, enzyme deficiency-related diseases or vitamin deficiency-related  
 CC diseases); and disorders of the kidney, liver, lung, breast, ovary,  
 CC uterus, prostate, testis, skin, stomach, pancreas, spleen, thymus and  
 CC thyroid (e.g., cancers). The present sequence represents a RACE (rapid  
 CC amplification of cDNA ends) PCR primer used in the isolation of cDNA  
 CC encoding human GPCRs. Note: The full sequence data for this patent did  
 CC not form part of the printed specification; those sequences not shown  
 CC were obtained in electronic format directly from WIPO at  
 XX ftp.wipo.int/pub/published\_pct\_sequences.

XX Synthesis of oligo:nucleotide(s) - using a single-stranded circular
PT oligo:nucleotide template ribonucleotide tri:phosphate(s) and a
PT polymerase to form multimer(s) which can be cleaved.
XX Example 2; Page 36; 100pp; English.
XX The linear multimer was produced by rolling circle synthesis in an
CC example of the method of the invention for synthesising an RNA
CC oligonucleotide, comprising combining a single-stranded circular
CC oligonucleotide template comprising at least one copy of a nucleotide
CC sequence complementary to the sequence of the desired RNA oligonucleotide
CC with at least 2 types of ribonucleotide triphosphate and a polymerase
CC enzyme to yield a single-stranded RNA oligonucleotide multimer
CC complementary to the circular oligonucleotide template, where the RNA
CC oligonucleotide multimer comprises multiple copies of the desired RNA
CC oligonucleotide. The methods can be used for producing RNA
CC oligonucleotides having a specific sequence and well defined ends. The
CC RNA oligonucleotides produced can be used as probes, standards and
CC diagnostic or therapeutic agents. They can be used for modifying the
CC structure or function of a target molecule. They can also be used to
CC cleave disease-associated RNA, DNA or protein

DR
XX Synthesizing RNA oligonucleotide involves combining single-stranded

```

```

PT circular oligonucleotide, ribonucleotide triphosphate and polymerase
PT enzyme to yield desired RNA complementary to circular oligonucleotide
XX template.
XX Example 2; SEQ ID NO 6; 78pp; English.
XX The invention relates to a method for synthesising an RNA
CC oligonucleotide, comprising combining a single-stranded circular
CC oligonucleotide template with at least two types of ribonucleotide
CC triphosphate and a polymerase enzyme to yield a single-stranded RNA
CC oligonucleotide multimer complementary to the circular oligonucleotide
CC template, where the RNA oligonucleotide multimer comprises multiple
CC copies of the desired RNA oligonucleotide. The method is useful for
CC synthesising an RNA oligonucleotide with well-defined ends. The circular
CC oligonucleotide is introduced into the cell using direct injection,
CC electroporation, calcium phosphate treatment, lipid-mediated delivery, or
CC cation-mediated delivery. The method is useful for treating bacterial
CC and/or viral infections in mammals, particularly drug resistant
CC infections, and for producing double stranded DNA oligomers. The method
CC is performed in the absence of an oligonucleotide primer, or without the
CC addition of auxiliary proteins. This sequence represents an
CC oligonucleotide used in the method of the invention.

XX
CC The invention relates to an isolated nucleic acid molecule (I) comprising
CC a nucleotide sequence given in Tables 1-9 (ABV0010-ABV62213) of the
CC specification or its complement. (I) is useful for: (a) assessing whether
CC a patient is afflicted with prostate cancer; (b) monitoring the
CC progression of prostate cancer in a patient; (c) assessing the efficacy
CC of a test compound to inhibit prostate cancer in a patient; (d) assessing
CC the efficacy of a therapy for inhibiting prostate cancer in a patient;
CC (e) selecting a composition for inhibiting prostate cancer in a patient;
CC (f) assessing the prostate cell carcinogenic potential of a compound; (g)
CC determining whether prostate cancer has metastasized in a patient; (h)
CC assessing the aggressiveness or indolence of prostate cancer in a patient
CC ; (i) is also useful as a pharmacodynamic or pharmacogenomic marker

 PT

PT Detection of multiple analytes, e.g. ligands, receptors, polynucleotides  
 PT and pollutants, involves adding a combination of sensitizer reagents and  
 PT reactive reagent Actuatable by a product of the sensitizer reagents.  
 XX  
 PS Example; Page 58; 87pp; English.  
 XX The invention relates to the detection of multiple components in a  
 CC medium, comprising combining the medium with at least two sensitizer  
 CC reagents, and at least one reactive reagent activated by a product  
 CC generated by the sensitizer reagents when activated; and differentially  
 CC activating the sensitizer reagents. The combination of sensitizer  
 CC reagents and reactive reagent(s) allows differential detection of the  
 CC components. Methods of the invention may be used for the detection of  
 CC ligands, receptors and polynucleotides, and also for the detection of  
 CC e.g. cells, various drugs, metabolites, pesticides (e.g. polyhalogenated  
 CC biphenyls, phosphate esters, thiophosphates, carbamates and  
 CC polyhalogenated sulfenamides) and pollutants. Methods of the invention  
 CC allow the detection of multiple analytes in a single test medium. An  
 CC application of the methods of the present invention would be in the field  
 CC of clinical diagnostics. The current sequence represents A24  
 CC oligonucleotide for the creation of oligonucleotide coated phthalocyanine  
 CC sensitizer particles (Pc-A24)

 PT Detecting presence of polynucleotide, differences between polynucleotide  
 PT sequences, useful for detecting single nucleotide polymorphism and  
 PT alleles of polynucleotide sequence involves use of three competitive

PT probes.  
 XX Example; Page 47; 75pp; English.  
 XX  
 CC This invention represents a method for detecting the presence of a  
 CC polynucleotide sequence, differences in polynucleotide sequences or  
 CC mutations in genomic DNA. The method involves contacting 3  
 CC oligonucleotide probes with a sample containing a polynucleotide. The  
 CC first probe hybridizes to a region of the polynucleotide sequence and the  
 CC second and third probes bind a second region of the polynucleotide  
 CC sequence. The second and third probes are identical except for the  
 CC presence or difference of one or more nucleotides. The reaction medium is  
 CC then subjected to conditions for forming substantially non-dissociative  
 CC ternolecular complexes, which can be at least one of, the polynucleotide  
 CC sequence with the first and second probes or the polynucleotide sequence  
 CC with the first and third probes. The oligonucleotide probes have labels  
 CC non-covalently bound to allow for their detection upon binding. The  
 CC method of the invention is useful for detecting the presence of a single  
 CC nucleotide polymorphism (SNP) in a fragment of genomic DNA. The method  
 CC can be used for the direct detection of nucleic acid in very small  
 CC quantities without amplification. In addition, the method may be carried  
 CC out with amplification of the target and reference sequences. This  
 CC sequence represents an oligonucleotide probe A24 used to create dotTAR  
 CC chemiluminescent sensitizer particles in the method of the invention.  
 CC Binding the nucleic acid to a suspendable particle acts as a support and  
 CC provides a means of segregating the bound polynucleotide target from the  
 CC bulk solution

 PT Generating mRNA-cDNA hybrids for suppressing cancer-related genes, or  
 PT treating or preventing microbe related genes, comprises thermocycling  
 PT steps of promoter-linked double-stranded cDNA or RNA synthesis.

XX  
 PS  
 XX Example 5; Page 26; 53pp; English.  
 CC The invention relates to generating mRNA-cDNA hybrids, comprising (a)  
 CC providing a solution containing a nucleic acid template, one or more  
 CC primers complementary to the sense conformation of the nucleic acid  
 CC template, and one or more promoter-linked primers complementary to the  
 CC antisense conformation of the nucleic acid template, and with an RNA  
 CC promoter, (b) treating the nucleic acid template with the one of more  
 CC primers to synthesize a first cDNA strand, (c) treating the first cDNA  
 CC strand with one or more promoter-linked primers to synthesize a promoter-  
 CC linked double-stranded nucleic acid, (d) treating the promoter-linked  
 CC double-stranded nucleic acid to synthesize amplified mRNA fragments and  
 CC (e) treating the mRNA fragments with one or more primers to synthesize  
 CC mRNA-cDNA hybrids by reverse transcription of the amplified mRNA  
 CC fragments. The method is useful for preparing high amounts of pure and  
 CC specific mRNA-cDNA hybrids for transducing biological effects of pure and  
 CC in vitro as well as in vivo, for inhibiting gene function in prokaryotes  
 CC and eukaryotes in vivo and in vitro, for suppressing cancer-related  
 CC genes, in treating or preventing microbe related genes, in studying  
 CC candidate molecular pathways with systematic knock out of involved  
 CC molecules, in high throughput screening of gene functions based on  
 CC microarray analysis, and as a tool in studying gene function in  
 CC physiological conditions. The mRNA-cDNA hybrids may be used to screen for  
 CC special gene functions, for manipulating gene expression in vitro, and  
 CC for designing therapy for genetic diseases in vivo. The cDNA part of a D-  
 CC RNAi (DNA-RNA interference) can be modified by nucleotide analogues  
 CC incorporation to increase the stability and effectiveness of transfected  
 CC probe activities. The RdRp (RNA dependent RNA polymerase) enzyme may  
 CC provide higher affinity of the mRNA template of a D-RNAi compared to ds-  
 CC RNA due to lower binding interaction between DNA-RNA duplexes than RNA-  
 CC RNA duplexes. The cDNA part of a D-RNAi provides further antisense gene  
 CC knockout activity in addition to the posttranscriptional gene silencing  
 CC (PTGS) mechanisms of the sense-RNA template, resulting in multiple  
 CC specific gene interference effects with one probe. The present sequence  
 CC is a poly(dT) PCR primer used in conjunction with oligo(dC)10N primers to  
 CC reverse transcribe mRNA into first strand cDNA in the method of the  
 CC invention

XX Characterizing cellular activity of compound, by receiving images of
PT cells with known activity and images of cells treated with compound,
PT characterizing phenotypic attributes of images and comparing the
PT phenotypes.
XX
XX Disclosure; Fig 18; 139pp; English.
XX
XX This invention relates to a novel method for the characterisation of the
CC activity of a compound on cell. The method involves receiving images of
CC cells with a cellular activity and images of other cells treated with the
CC compound, quantitatively characterising phenotypic attributes of the
CC image of cells with a cellular activity to produce a target phenotype for
CC the cellular activity and that of the image of other cells to produce a
CC second phenotype for the compound, and comparing the two phenotypes to
CC determine whether the compound possesses cellular activity. The invention
CC may be useful for characterising cellular activity of a compound, for
CC determining information about properties of substances based upon the
CC information about structure of living or non-living cells exposed to
CC substances. The invention is also useful for identifying promising
CC candidates in a search for new and better medicines and treatments using
CC multiple biological descriptors from a single cell markers or components.

XX
XX Identifying a candidate polymorphic repeat within a coding sequence, for
PT understanding or treating genetic disease, comprises detecting tandem
PT repeats in a target coding sequence and scoring the repeats for
PT polymorphic probability.
XX
XX Example; Col 579; 588pp; English.
XX
XX The invention discloses a method for identifying a candidate polymorphic
CC repeat within a coding sequence (expressed sequence tag, EST), which
CC comprises detecting tandem repeats in a target coding sequence, scoring
CC the repeats for polymorphic probability and generating a dataset
CC correlating the repeats with polymorphic probability to identify a
CC candidate polymorphic repeat. The computational methods (polymorphic
CC marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are
CC useful for identifying and detecting candidate polymorphic repeats in
CC human genes, which can be used to understand, treat or eliminate genetic
CC diseases, predispositions or adverse drug-treatment reactions. Examples
CC of diseases linked to nucleotide repeats are Machado-Joseph, Haw River
CC syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxia,
CC myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and
CC spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are
CC the polymorphic repeats identified for a search of human ESTs

PT New immunostimulatory nucleic acid, useful for preparing a composition
XX for treating an allergic condition.
XX
PS Example 1; Page 44; 115pp; English.
XX
CC The present invention describes immunostimulatory nucleic acids of 14-100
CC nucleotides in length comprising the formula 5' X1DCGHX2 3' (I), where X1
CC or X2 = independently any sequence 0-10 nucleotides; D = nucleotide other
CC than C; C = cytosine; G = guanine; H = nucleotide other than G. The
CC immunostimulatory nucleic acid further comprises a sequence consisting of
CC P and N positioned immediately 5' to X1 or 3' to X2 and N is a B cell
CC neutralising sequence, where N begins with a CGG trinucleotide and is at
CC least 10 nucleotides long and P is GC-rich palindromic containing sequence
CC at least 10 nucleotides long. Also described: (1) a pharmaceutical
CC composition comprising the immunostimulatory nucleic acid and a carrier;
CC and (2) treating an allergic condition. (I) has anti-allergic activity and
CC can be used in gene therapy. (I) can be used for preparing a composition
CC for treating a variety of immune related disorders such as cancer,
CC infectious diseases and allergic disorders. (I) also stimulates the
CC activation of natural killer cells and the production of type 1
CC interferon (IFN). The present sequence represents an immunostimulatory
CC oligonucleotide, which is used in an example from the present invention

PT Improved polymerase thermocycling reaction for nucleic acid
PT amplification, by thermal cycling of promoter-linked nucleic acid
PT template synthesis and in vitro transcriptional amplification of nucleic
PT acid sequences.
XX
PS Example 7; Page 14; 28pp; English.
XX
XX The invention relates to an improved polymerase thermocycling reaction
XX (M1) for linear amplification of nucleic acid sequences, involves

```

```

CC denaturing a number of nucleic acid templates (I), combining the
CC denatured (I) with a promoter-containing primer (P1), a primer (P2), a
CC number of deoxynucleotide triphosphates and ribonucleotide triphosphates,
CC a reverse transcription enzyme, a DNA-dependent DNA polymerase and RNA
CC polymerase, contacting P1 with (I) to generate a number of promoter-
CC containing templates, denaturing the promoter-containing templates,
CC generate a number of promoter-containing double-stranded templates to
CC where the double-stranded nucleic acid templates are flanked by P1 in one
CC end and P2 in the other end of the other orientation, transcribing the
CC promoter-containing double-stranded DNA templates to form a number of
CC amplified RNA sequences, including the primer region of the promoter-
CC containing double-stranded DNA templates, contacting the amplified RNA
CC sequences with P2 to form a number of cDNAs and a number of DNA-RNA
CC hybrid templates, and denaturing the DNA-RNA hybrid templates. The method
CC is useful for improved polymerase thermocycling reaction for linear
CC amplification of nucleic acid sequences, and thus for producing mRNA
CC expression profile of a cell by M1 to generate multiple copies of the
CC mRNA. M1 is also useful for determining aberrant protein production of
CC cells in a diseased state, by generating an expression profile by the
CC above method, of cells in both normal and diseased states, comparing the
CC expression profile of the cells in the normal and diseased states,
CC determining the differences in mRNA composition of the cell(s) in the
CC diseased state, isolating the mRNA sequences of cell(s) in the diseased
CC state that differ from mRNA in cell(s) in non-diseased state, amplifying
CC the isolated mRNA by M1, and determining aberrant protein function of the
CC protein coded for by the isolated mRNA. M1 is also useful for treating a
CC cell in a diseased state caused by aberrant protein production, by
CC determining protein expression of a cell in a diseased state, determining
CC the mRNA sequence for the aberrant proteins, synthesising an antisense
CC sequence of the mRNA, amplifying the antisense mRNA sequences by M1, and
CC delivering a pharmaceutically effective dosage of a composition
CC comprising the anti-sense mRNA and a compatible lipid based biological
CC carrier. M1 is also useful for predicting the efficacy of a proposed drug
CC targeted against an aberrant protein, by determining aberrant protein
CC production of cell in a diseased state by the above method, amplifying
CC the aberrant protein by M1 and using recombinant techniques to determine
CC the effect of proposed drug on the aberrant protein. M1 is also useful
CC for differential screening of tissue-specific gene expression at a
CC cellular level, for preparing labeled RNA/DNA probes for a gene chip
CC technology, and for determining the efficacy of a drug regiment against a
CC gene or its cDNAs. The present sequence is an Oligo (dT)24 RT-(reverse
CC transcriptase) PCR primer used to produce first strand cDNA in the method
XX of the invention

 CC The invention relates to a method of amplification of nucleic acid which  
 CC comprises primer extension by reverse transcriptase and hybridizing an  
 CC oligonucleotide to the single stranded DNA, where the oligonucleotide is  
 CC blocked from extension at the 3' end. The method is useful for  
 CC amplification of nucleic acids. In the new method, a promoter is  
 CC protected from degradation throughout the method. The promoter is  
 CC constructed so that it does not serve as a primer for extension of a  
 CC sequence that is complementary to the target sequence, i.e. it is  
 CC blocked. The method can be combined with other processes to eliminate the  
 CC need for multiple steps and varying reaction conditions and their  
 CC associated problems. At least three otherwise separate enzymatic  
 CC reactions can occur consecutively in one phase (i.e., without organic  
 CC extraction and precipitation), more preferably in the same reaction  
 CC vessel. Preferably, cDNA synthesis according to the new method may occur  
 CC in a modified low salt buffer. The present sequence represents the poly A  
 CC tract of a mRNA used to illustrate the method of the invention.

PT Prevention or treatment of gastric ulcer involves administering nucleic
PT acid.
XX
PS Disclosure; Page 14; 45pp; English.
XX
CC The invention relates to a method of prevention or treatment of gastric
CC ulcer comprising administering a nucleic acid to a subject in need for
CC treatment of gastric ulcer. A nucleic acid sample comprising
CC oligonucleotide 2006 was administered to a mouse model by an oral route
CC or a vehicle control. Colonisation of mice by Helicobacter pylori was
CC assessed at time points from 1 day to 1 month after treatment. The
CC ability of the nucleic acid to reduce H. pylori colonisation was
CC assessed. The method is useful for preventing or treating a gastric ulcer
CC on a subject e.g. human or non-human vertebrate animal including dog,
CC cat, horse (equine gastric ulcer syndrome, EGUS), cow, goat, sheep, pig,
CC rabbit, turkey, chicken, primate, rat and mouse. The method effectively
CC treats or prevents gastric ulcers. The present sequence represents an
CC immunostimulatory nucleic acid for the treatment of gastric ulcers

CC New immunostimulatory oligonucleotide comprising non-palindromic nucleic
CC acid sequence motif, useful for inducing B-cell activation, treating,
CC preventing or ameliorating immune system disorder or tumoral disease e.g.
CC melanoma.
XX
PS Example 3; SEQ ID NO 19; 139pp; English.
XX
CC This invention relates to novel immunostimulatory oligonucleotides that
CC contain a non-palindromic sequence motif. Specifically, it refers to DNA
CC oligonucleotides (without a CpG motif), which can stimulate an immune
CC response in animals of the order of primate, including humans. The immune
CC response is characterised by the proliferation, differentiation, cytokine
CC and antibody production in B-cells, as well as cell differentiation and
CC cytokine production in plasmacytoid dendritic cells. The present
CC invention describes immunomodulator compositions that also comprise an
CC antigen selected from, for example, viruses, bacteria, parasites, tumour
CC cells and glycolipids. As such, these DNA oligos can be used in gene
CC therapy for inducing B-cell activation, treating, preventing or
CC ameliorating an immune system disorder or a tumoral disease including
CC chronic myelogenous leukaemia, melanoma, Kaposi's sarcoma, and renal cell
CC carcinoma. This oligonucleotide sequence is the non-CpG DNA oligo IMT
CC 053, used in an exemplification of the invention.

PT New calix(4)arene-nucleoside hybrid useful in gene therapy has at least  
PT one nucleoside attached to a calix(4)arene group through amide bonding,  
PT and is derived from a calix(4)arene having amino groups.  
XX  
PS Claim 7; Page 20; 16pp; English.  
XX  
CC The present sequence is that of a calix(4)arene-oligonucleotide hybrid of  
CC the invention, which includes a calix(4)arene-nucleoside (preferably  
CC thymidine) derivative. The calix(4)arene-oligonucleotide hybrid functions  
CC as a DNA hairpin structure mimic. It effectively recognises DNA or RNA  
CC through triplex formation by bonding between the calix(4)arene-containing  
CC cavity and a biologically active substance. The hybrid has a certain  
CC level of both rigidity and flexibility, is stable in vivo, has high cell  
CC permeability and can be mass-produced. It can be used as a DNA sensor or  
CC for gene therapy

PS Example 3; Page 28; 64pp; German.
XX The invention describes a method of typing (M1) a gene (I) that has one
CC or more polymorphic microsatellite loci (PML). The method comprises: PCR
CC amplification of at least one DNA region of (I) that includes PML, using
CC as template a DNA sample containing at least one segment of (I); and
CC determining the length of the resulting amplicon(s). Also described are:
CC a method of determining (M2) microsatellite markers (NM) for
CC predisposition to a disease, associated with a gene that includes one or
CC more PML; and prediagnosis (M3) of diseases associated with gene that
CC include PML. The method is used to identify microsatellite markers, in a
CC disease-related gene, that are associated with a predisposition to
CC diseases and for prediagnosis of such diseases, especially prion diseases
CC but also cystic fibrosis, malignant hyperthermia syndrome in pigs and
CC metabolic diseases; also to type genes that encode milk proteins,
CC hormones or transcription factors. The method is simpler, quicker and
CC particularly less expensive than known methods based on sequencing. This
CC sequence represents a primer used to genotype a region of the cow prion
CC protein (PrP) comprising a polymorphic microsatellite locus.

PT Set of energy-transfer fluorescent labels with donor and acceptor at
PT different separations - useful for DNA sequencing allows use of fewer
PT analysing wavelengths or an increased throughput.
XX
PS Example 1; Page 14; 30pp; English.
XX
CC The present sequence exemplified the primer of the invention, and is
CC used to sequence Incyte clone 1 (AAV42737). The primer of the invention
CC is labelled with a set of at least 2 different fluorescent labels. The
CC set comprises an energy-transfer fluorescent label with at least 1 each
CC of a donor fluorophore and an acceptor fluorophore capable of energy
CC transfer, and separated by a distance x, and a second similar fluorescent
CC label in which the separation distance is y, x and y being sufficiently
CC different for the two fluorescent labels to produce distinct fluorescent
CC signals. Fluorescent labels are useful in multicomponent analyses, e.g.
CC as probes for fluorescent in situ hybridisation or especially as primers

PS  Claim 1; Page 56; 83pp; English.
XX
CC  Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide
CC  primer extension (SNPE) primers, and the sequences of regions flanking
CC  sites of single nucleotide polymorphisms SNPs. The present invention
CC  includes kits for determining the presence or absence of a SNP, using the
CC  oligonucleotides of the invention. The PCR primers are used to amplify a
CC  SNP flanking sequence, the SNPE primer is used as a genotyping primer.
CC  The oligonucleotides are useful for genotyping a nucleic acid sample by
CC  performing a single-nucleotide primer extension reaction. The
CC  oligonucleotides are useful for determining the presence, absence or
CC  identity of a SNP and for genotyping nucleic acid samples, for e.g. to
CC  assess by association analysis the genotype of an individual or group of
CC  individuals, having a pathological phenotypic trait suspected of being
CC  caused by one or more SNPs. Phenotypic traits include diseases e.g.
CC  agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular
CC  dystrophy, familial hypercholesterolaemia, polycystic kidney disease,
CC  osteogenesis imperfecta and acute intermittent porphyria. Phenotypic
CC  traits also include symptoms of or susceptibility to multifactorial
CC  disease of which a component is or may be genetic such as autoimmune
CC  diseases, including, rheumatoid arthritis, multiple sclerosis,
CC  inflammation, cancer, nervous system diseases and infection by pathogenic
CC  microorganism. The method is also useful in forensic investigations and
CC  paternity analysis. The present sequence represents a single nucleotide
CC  primer extension (SNPE) primer specific for a human SNP containing DNA

CC  the present invention. The present invention describes a method for
CC  synthesising a selected oligonucleotide (I) having well defined ends. The
CC  method comprises: (a) annealing a primer to a single-stranded (ss)
CC  circular template to yield a primed circular template, where the template
CC  comprises: (i) at least one nucleotide sequence complementary to (I); and
CC  (ii) at least one nucleotide effective to produce a cleavage site in the
CC  oligonucleotide multimer; (b) combining the primed circular template with
CC  at least two types of nucleotide triphosphates and a polymerase enzyme
CC  without the addition of auxiliary proteins to yield a ss oligonucleotide
CC  multimer complementary to the circular oligonucleotide template,
CC  comprising multiple copies of (I); and (c) cleaving the oligonucleotide
CC  multimer at the cleavage site to produce (I) having well defined ends
CC  The method is used for the large-scale synthesis of DNA and RNA oligomers
CC  for use, e.g. as probes and diagnostic agents and/or therapeutic agents

PT Synthesizing RNA oligonucleotide involves combining single-stranded  
PT circular oligonucleotide, ribonucleotide triphosphate and polymerase  
PT enzyme to yield desired RNA complementary to circular oligonucleotide  
PT template.  
XX  
XX  
PS Example 2; SEQ ID NO 5; 78pp; English.  
XX  
XX The invention relates to a method for synthesising an RNA  
CC oligonucleotide, comprising combining a single-stranded circular  
CC oligonucleotide template with at least two types of ribonucleotide  
CC triphosphate and a polymerase enzyme to yield a single-stranded RNA  
CC oligonucleotide multimer complementary to the circular oligonucleotide  
CC template, where the RNA oligonucleotide multimer comprises multiple  
CC copies of the desired RNA oligonucleotide. The method is useful for  
CC synthesising an RNA oligonucleotide with well-defined ends. The circular  
CC oligonucleotide is introduced into the cell using direct injection,  
CC electroporation, calcium phosphate treatment, lipid-mediated delivery,  
CC cation-mediated delivery. The method is useful for treating bacterial  
CC and/or viral infections in mammals, particularly drug resistant  
CC infections, and for producing double stranded DNA oligomers. The method  
CC is performed in the absence of an oligonucleotide primer, or without the  
CC addition of auxiliary proteins. This sequence represents an  
CC oligonucleotide used in the method of the invention.

 XX An isolated polypeptide with aminopeptidase activity, for preparing food  
 compositions, such as bread and cheese, with enhanced flavoring.  
 XX Example 5; Page 40; 94pp; English.  
 XX The invention relates to an isolated polypeptide with aminopeptidase  
 activity and the gene encoding it (including sequences complementary to  
 the gene and which hybridise to it at high stringency), from Aspergillus  
 niger. Also included are a nucleic acid construct comprising the above  
 polynucleotide operably linked to one or more control sequences that  
 direct the production of the polypeptide in a suitable expression host, a  
 recombinant expression vector comprising the above nucleic acid  
 construct, a recombinant host cell comprising the above construct or  
 vector, and producing the protein comprising cultivating an above strain/  
 recombinant host cell to produce a supernatant and/or cells comprising  
 the polypeptide and recovering the polypeptide. The aminopeptidase is  
 used to prepare a food composition such as dough to enhance the flavour  
 of a baked product from the dough and for preparing a cheese to enhance  
 the flavour. The invention provides a bacterial enzyme for protein  
 hydrolysis i.e. with aminopeptidase activity, to produce flavouring  
 agents, and the enzyme has been isolated and characterised, compared to a  
 previously observed weak aminopeptidase activity which was detected in an  
 Aspergillus niger culture filtrate but the source was never isolated or  
 identified. The use of enzymes to produce flavouring agents from  
 proteinaceous material is better than use of strong acids which can  
 severely degrade the amino acids obtained. The present sequence is a  
 reverse transcriptase (RT)-PCR primer used to investigate the intron-exon  
 structure of the aminopeptidase gene

 XX Detecting an analyte in a sample comprises providing nucleic acid  
 sequence which is catalytically active in presence of analyte, contacting  
 catalytic nucleic acid with substrate and amplifying catalytic product.  
 XX Disclosure; Page; 36pp; English.  
 XX The invention relates to a method of detecting an analyte in a sample.  
 XX The method comprises providing a nucleic acid sequence which is initially  
 XX catalytically inactive, but which becomes catalytically active in the  
 XX presence of an analyte (the effector); providing a nucleic acid substrate  
 XX for the catalytic activity of the nucleic acid sequence; and contacting  
 XX the nucleic acid sequence and the substrate with the sample under  
 XX conditions allowing catalytic activity of nucleic acid sequences. The  
 XX catalytic nucleic acid sequence will be able to convert the nucleic acid  
 XX substrate into a nucleic acid product only if the analyte of interest is  
 XX present. The nucleic acid catalytic product is then amplified, and a  
 XX significant increase in the amount of product indicates the presence of  
 XX the analyte in the sample. The method is useful for the qualitative or  
 XX quantitative determination of an analyte in a sample in diagnostic or  
 XX assays. The invention describes the in vitro selection of a ribozyme  
 XX ligase (L1; AAA57859, AAA57860) which is catalytically active only in the  
 XX presence of an oligonucleotide effector (AAA57854). The L1 ribozyme  
 XX ligase was selected from a pool of RNA molecules comprising a central  
 XX randomised region 90 nucleotides in length flanked on both sides by  
 XX constant sequence regions (the N90 RNA pool; AAA57851). In the presence  
 XX of the effector, selection was performed using one of the tagged  
 XX substrate molecules AAA57855-A57857. RNAs with ligase activity (i.e.,  
 XX those which have become ligated to the substrate molecule) were reverse  
 XX transcribed using the effector oligo, and then PCR amplified using the  
 XX effector and a DNA primer identical in sequence to the substrate used for

XX Example 6; SEQ ID NO 25; 78pp; English.  
XX  
XX The invention relates to a regulatable, catalytically active nucleic acid  
CC (RCANA) segment comprising an effector domain and a nucleic acid catalyst  
CC domain in which one or more critical catalytic residues of the nucleic  
CC acid catalyst have been randomised, where the kinetic parameters of the  
CC catalytic domain are regulated by an effector that interacts with the  
CC effector domain. Also included are a nucleic acid comprising a gene, a  
CC RCANA inserted within the gene (where the presence of an effector causes  
CC the nucleic acid to catalyse a reaction), isolating an RCANA (comprising  
CC a catalytic and an effector domain involving randomising at least one  
CC nucleotide in the catalytic domain of a catalytically active nucleic acid  
CC to create a nucleic acid pool, removing from the nucleic acid pool those  
CC nucleic acids that interact with the catalytic target of the catalytic  
CC domain, adding an effector molecule to the nucleic acids and isolating  
CC those nucleic acids that interact with the catalytic target of the  
CC catalytic domain), detection of a target using a RCANA, modifying a  
CC target using a RCANA (involving providing a RCANA capable of target-  
CC specific modification and modifying the target under conditions that  
CC cause a RCANA-specific activity), selecting an RCANA and detecting an  
CC RCANA (involving isolating an RCANA, creating a construct in which the  
CC nucleic acid is in position to regulate the expression of a reporter  
CC gene, introducing the construct into a host cell and measuring the

CC catalytic activity of the nucleic acid upon exposure of the host cell to  
CC the effector. The RCANA is useful for regulating production of a product  
CC in a cell (by gene therapy) which involves inserting into a gene that  
CC produces the product or regulates the production of the product in the  
CC cell an RCANA which comprises a catalytic domain, that modifies a  
CC transcript to alter its coding potential, and a regulatory domain which  
CC recognises an effector that alters the function of the catalytic domain,  
CC contacting the regulatory domain with an effector thereby regulating  
CC production of the product. The concentration of the effector modulates  
CC the activity of the catalytic domain of the RCANA. The production of the  
CC product is fully inhibited or is increased compared to a normal control  
CC level, or is partially inhibited according to the concentration of the  
CC effector. The RCANA blocks or activates expression of the gene. The  
CC effector is the product, where it accesses feedback inhibitor of the  
CC gene. The product is produced in a metabolic pathway that is being  
CC regulated, and the effector or the product is an intermediate in a  
CC metabolic pathway. The effector is endogenous or exogenous to the cell.  
CC The effector is an end product of a biosynthetic process. The effector or  
CC the product is chosen from protein, enzyme, protein pharmaceutical,  
CC metabolite, drug, dye, vitamin, food additive, chemical additive,  
CC pesticide, insecticide, feed compound, and a waste product. The drug is  
CC chosen from antibiotics, anticancer drugs, antifungals, cholesterol-  
CC lowering drugs, and immunosuppressants. The RCANA is useful for  
CC regulating a biological pathway in a cell, for screening a population of  
CC cells for a cell that produces a bioproduct, for modulating expression of  
CC a nucleic acid, in gene therapy applications, and for facilitating  
CC industrial biosynthesis and bioremediation. The present sequence is an  
CC RNA substrate molecule for an RCANA containing the catalytic region of  
CC ribosomal L1 ligase.

PT Detaching nucleic acid molecule comprising unconventional nucleotide  
 PT incorporated at predetermined site from a solid support involves cleaving  
 PT the nucleic acid molecule at the site of unconventional nucleotide.

PS Disclosure; Page 16; 47pp; English.

XX The present invention is concerned with the cleavage of nucleic acids  
 CC from solid supports. This is carried out by adding a non-conventional  
 CC nucleotide into the nucleic acid attached to the support, so that it is  
 CC recognised and cleaved by a specific DNA glycosylase and the sequence is  
 CC released. This is useful in many molecular biological procedures such as  
 CC sequencing, in vitro amplifications, cDNA and template preparation, DNA-  
 CC based assays, mutagenesis procedures, nucleic acid purification and  
 CC affinity chromatography. The present sequence is an oligonucleotide used  
 CC in assays to demonstrate the methods of the invention

 CC The present sequence is a human clusterin cDNA target for a double-  
 CC stranded short interfering RNA (siRNA) of the invention ADL70522-  
 CC ADL70523. It was used in an example from the invention to demonstrate

CC clusterin gene silencing in PC-3 prostate cancer cells. Clusterin, also  
CC known as testosterone-repressed prostate message-2 (TRPM-2) or sulfated  
CC glycoprotein-2 (SGP-2), is expressed in increased amounts by prostate  
CC tumour cells following androgen withdrawal, and has also been shown to be  
CC critical for neuritic toxicity in mouse models of Alzheimer's disease.  
CC siRNAs of the invention can be used alone or in combination with other  
CC chemotherapy or apoptosis inducing treatments for the treatment of  
CC prostate cancer, sarcomas such as osteosarcoma, renal cell carcinoma,  
CC breast cancer, bladder cancer, lung cancer, colon cancer, ovarian cancer,  
CC anaplastic large cell lymphoma and melanoma, and also for the treatment  
CC of Alzheimer's disease.

PT Creating an insertional mutation in the germ line of an animal, useful  
PT for generating a mutation in an offspring of an animal, comprises  
PT introducing into an animal a nucleic acid molecule comprising a germ line  
PT specific promoter.  
XX  
PS Example 4; SEQ ID NO 151; 102pp; English.  
XX  
CC The invention describes a method of creating an insertional mutation in  
CC the germ line of an animal by introducing into an animal a nucleic acid  
CC molecule comprising a germ line specific promoter. The method is useful  
CC for generating a mutation in an offspring of an animal, or for isolating  
CC a nucleic acid from a genome of an offspring of an animal. The method may  
CC also be used to correct genetic defects in animals, especially humans.  
CC The nucleic acid is useful for generating mutations in a cell for  
CC assessing the frequency with which selected cells under go insertional  
CC mutagenesis for the generation of transgenic animals. This sequence  
CC represents a primer used to characterise the insertion site of the  
CC L1/enhanced green fluorescent protein (EGFP) retrotransposon cassette  
CC into the mouse genome.

PT New sequence determination oligonucleotides, useful for detecting
XX polymorphic sites in a 5' flanking region of a CYP2D6 gene, as
XX hybridization probes, as components of diagnostic assays, or in ligase-
XX based sequence determination.
XX
PS Claim 2; Page 23; 63pp; English.
XX
CC The invention relates to sequence determination oligonucleotides for
XX detecting polymorphic sites in a 5' flanking region of cytochrome P450
XX 2D6 (CYP2D6) gene. CYP2D6 enzymes are involved in the metabolism of many
XX different xenobiotics. Human CYP2D6 gene is located on chromosome 22. The
XX oligonucleotides may be used as in situ hybridisation probes, in ligase-
XX based sequenced determination, as components of diagnostic assays, as
XX probes in sequence determination methods based on mismatches, as
XX hybridisation-based diagnostic assays, and as components of diagnostic
XX microarray. CYP2D6 is useful to predict variations in an individual's
XX ability to metabolise certain drugs. The present sequence is a sense
XX oligonucleotide used for detecting of human CYP2D6 gene 5' flanking
XX region single nucleotide polymorphism (SNP)

PS Example 17; Page 82; 139pp; English.  
 XX  
 CC This invention relates to novel immunostimulatory oligonucleotides that  
 CC contain a non-palindromic sequence motif. Specifically, it refers to DNA  
 CC oligonucleotides (without a CpG motif), which can stimulate an immune  
 CC response in animals of the order of primates, including humans. The immune  
 CC response is characterised by the proliferation, differentiation, cytokine  
 CC and antibody production in B-cells, as well as cell differentiation and  
 CC cytokine production in plasmacytoid dendritic cells. The present  
 CC invention describes immunomodulator compositions that also comprise an  
 CC antigen selected from, for example, viruses, bacteria, parasites, tumour  
 CC cells and glycolipids. As such, these DNA oligos can be used in gene  
 CC therapy for inducing B-cell activation, treating, preventing or  
 CC ameliorating an immune system disorder or a tumoral disease including  
 CC chronic myelogenous leukaemia, melanoma, Kaposi's sarcoma, and renal cell  
 CC carcinoma. This oligonucleotide sequence is a non-CpG DNA oligo of the  
 CC invention.

 CC The invention describes a method of typing (M1) a gene (I) that has one  
 CC or more polymorphic microsatellite loci (PML). The method comprises: PCR  
 CC amplification of at least one DNA region of (I) that includes PML, using  
 CC as template a DNA sample containing at least one segment of (I); and  
 CC determining the length of the resulting amplicon(s). Also described are:  
 CC a method of determining (M2) microsatellite markers (MM) for  
 CC predisposition to a disease, associated with a gene that includes one or  
 CC more PML; and predisposition (M3) of diseases associated with gene that  
 CC include PML. The method is used to identify microsatellite markers, in a

CC disease-related gene, that are associated with a predisposition to  
 CC diseases and for prediagnosis of such diseases, especially prion diseases  
 CC but also cystic fibrosis, malignant hyperthermia syndrome in pigs and  
 CC metabolic diseases; also to type genes that encode milk proteins,  
 CC hormones or transcription factors. The method is simpler, quicker and  
 CC particularly less expensive than known methods based on sequencing. This  
 CC sequence represents a primer used to genotype a region of the cow prion  
 CC protein (PrP) comprising a polymorphic microsatellite locus.

CC The invention relates to a kit for diagnosing and treating T-cell  
 CC associated diseases which comprises a panel of nucleic acid primers  
 CC specifically priming and allowing amplification of each Vbeta gene,  
 CC VbetARNA or cDNA. The kit is useful for diagnosing organ transplant  
 CC rejection and diagnosing and treating T-cell associated diseases  
 CC including autoimmune diseases, degenerative nervous system diseases,  
 CC graft versus host disease, hypersensitivity diseases, infectious diseases  
 CC and neoplastic diseases. Autoimmune diseases include Addison's disease,  
 CC atrophic gastritis. Degenerative nervous system diseases include multiple  
 CC sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type  
 CC I hypersensitivities such as contact with allergens that lead to  
 CC allergies, Type II hypersensitivities such as those present in  
 CC Goodpasture's syndrome and Type IV hypersensitivities such as those  
 CC manifested in leprosy. Infectious diseases include viral infections  
 CC caused by viruses such as HIV, fungal infections such as those caused by  
 CC the yeast genus Candida, parasitic infections such as those caused by  
 CC schistosomes, filaria and bacterial infections such as those caused by  
 CC Mycobacterium. Neoplastic diseases include lymphoproliferative diseases  
 CC such as leukaemias, lymphomas and cancers such as cancer of the brain,  
 CC breast. The present sequence represents a Vbeta gene repeat sequence.

Creating an insertional mutation in the germ line of an animal, useful
for generating a mutation in an offspring of an animal, comprises
introducing into an animal a nucleic acid molecule comprising a germ line
specific promoter.
Example 2; SEQ ID NO 94; 102pp; English.
The invention describes a method of creating an insertional mutation in
the germ line of an animal by introducing into an animal a nucleic acid
molecule comprising a germ line specific promoter. The method is useful
for generating a mutation in an offspring of an animal, or for isolating
a nucleic acid from a genome of an offspring of an animal. The method may
also be used to correct genetic defects in animals, especially humans.
The nucleic acid is useful for generating mutations in a cell for
assessing the frequency with which selected cells under go insertional
mutagenesis for the generation of transgenic animals. This sequence
represents an exemplary cleavage site of the endonuclease encoded by
human L1 retrotransposon EN domain.

 PT Amplifying RNA sequences, useful in detecting diseases or mutation,  
 PT comprises synthesizing first strand cDNA, circularizing first strand  
 PT cDNA, and replicating the circularized cDNA molecules by rolling circle  
 PT replication.  
 XX  
 PS Disclosure; SEQ ID NO 6; 64pp; English.  
 XX  
 CC The present invention relates to composition and method for amplifying  
 CC RNA sequences. The method involves synthesising first strand cDNA  
 CC molecules from RNA molecules, circularising the first strand and  
 CC replicating the circularised first strand cDNA molecules using rolling  
 CC circle replication. The method is useful for producing nucleic acid  
 CC molecules corresponding to RNA molecules in an RNA sample, for  
 CC identifying or analysing and comparing RNA molecules and/or sequences  
 CC expressed in different cells, tissues and/or samples. The invention is  
 CC also useful in detecting disease (e.g. cystic fibrosis, muscular  
 CC dystrophy or diabetes), mutation detection, gene discovery, gene mapping  
 CC (molecular haplotyping), agricultural research, and assessment of  
 CC predisposition for cancers, e.g. prostate, breast, lung, colon or ovarian  
 CC cancer. The present sequence is a junction-specific cDNA primer. This  
 CC sequence is used to illustrate the method of invention.

 XX New oligomers contg. modified bases - which form a triplex with G-C  
 PT doublet in a DNA duplex, for treating and diagnosing HIV, hepatitis,  
 PT herpes malignancy and inflammation.  
 XX  
 PS Claim 12; Page 71; 77pp; English.  
 XX  
 CC The synthetic oligomer is capable of forming a triplex at physiological  
 CC pH with a purine rich target sequence by coupling into the major groove  
 CC of the duplex. The specific target sequence of this oligomer is the human  
 CC interleukin 6 gene untranslated sequence contg. a purine rich sequence  
 CC coned on one strand of the duplex. The oligomer, and others like it are  
 CC useful in diagnosis and therapy of diseases characterised by specific DNA  
 CC duplex targets, e.g. HPV, HER, HIV, hepatitis B, herpes, malignant  
 CC tumours and inflammation. The triple helices form under mild conditions  
 CC thus assays may be carried out without subjecting the test specimen to  
 CC harsh conditions. The oligomer contains an inverted polarity region  
 CC formed from an o-xyloso dimer synthon. The linking gp. is o-xyloso  
 CC (nucleotides have the 3 positions of xylose sugars linked via the o-  
 CC xylene ring). Two nucleotides are coupled through a xylene residue to  
 CC form the dimer synthon. This additional modifications may render the  
 CC oligomer stable to nuclease activity. The oligomer is able to inhibit  
 CC gene expression, as verified by in vitro systems. See also AAQ25452-25501  
 CC and AAQ30226-448. (Updated on 25-MAR-2003 to correct PN field.)

PT	New oligomers contg. modified bases - which form a triplex with		
PT	doublet in a DNA duplex, for treating and diagnosing HIV, hepat		
PT	herpes malignancy and inflammation.		
XX			
PS	Claim 12; Page 71; 77pp; English.		
XX			
CC	The synthetic oligomer is capable of forming a triplex at physi		
CC	pH with a purine rich target sequence by coupling into the major		
CC	of the duplex. The specific target sequence of this oligomer is		
CC	interleukin 6 gene untranslated sequence contg. a purine rich s		
CC	concd. on one strand of the duplex. The oligomer, and others li		
CC	useful in diagnosis and therapy of diseases characterised by sp		
CC	duplex targets, e.g. HPV, HBV, HCV, hepatitis B, herpes, malign		
CC	tumours and inflammation. The triple helices form under mild co		
CC	thus assays may be carried out without subjecting the test spec		
CC	harsh conditions. The oligomer contains an inverted polarity re		
CC	formed from an o-xylosa dimer synthon. The linking gp. is o-xy-		
CC	(nucleotides have the 3'positions of xylose sugars linked via t		
CC	xylene ring). Two nucleotides are coupled through a xylene resi		
CC	form the dimer synthon. This additional modifications may rende		
CC	oligomer stable to nuclease activity. The oligomer is able to i		
CC	cene expression, as verified by in vitro systems. See also AAQ2		
CC	and AAQ30226-448. (Updated on 25-MAR-2003 to correct PN field.)

 XX XX Determining if a gene product/compound is involved in preventing  
 PT replication error in a cell, useful for treating cancer, comprises  
 PT determining expression level of a marker gene in a cell treated with a  
 PT gene product inhibitor/compound.  
 XX XX Disclosure; Fig 3; 25pp; English.  
 XX XX The present invention relates to a method for determining if a gene  
 CC product or compound is involved in preventing replication error in a  
 CC cell. The method involves providing a cell with a specific inhibitor for  
 CC a gene product or with a compound and determining the expression level of  
 CC a marker gene in the cell, where the expression level of the marker gene  
 CC is dependent on the occurrence of a replication error. The invention is  
 CC useful in gene therapy and for treating a subject having tumours or  
 CC cancer. The present sequence is a Caenorhabditis elegans heat-shock  
 CC promoter DNA. This sequence is used to illustrate the method of  
 CC invention.

XX
XX Typing genes that contain polymorphic microsatellite loci, useful for
XX identifying predisposition to disease, by amplification and determining
XX length of amplicons.
XX
XX Example 3; Page 28; 64pp; German.
XX
XX The invention describes a method of typing (M1) a gene (I) that has one
XX or more polymorphic microsatellite loci (PML). The method comprises: PCR
XX amplification of at least one DNA region of (I) that includes PML, using
XX as template a DNA sample containing at least one segment of (I); and
XX determining the length of the resulting amplicon(s). Also described are:
XX a method of determining (M2) microsatellite markers (MM) for
XX predisposition to a disease, associated with a gene that includes one or
XX more PML; and prediagnosis (M3) of diseases associated with gene that
XX include PML. The method is used to identify microsatellite markers, in a
XX disease-related gene, that are associated with a predisposition to
XX diseases and for prediagnosis of such diseases, especially prion diseases
XX but also cystic fibrosis, malignant hyperthermia syndrome in pigs and
XX metabolic diseases; also to type genes that encode milk proteins,
XX hormones or transcription factors. The method is simpler, quicker and
XX particularly less expensive than known methods based on sequencing. This
XX sequence represents a primer used to genotype a region of the cow prion
XX protein (PrP) comprising a polymorphic microsatellite locus.

XX Generating a mutation in a gene using a dominant negative allele of a  
PT mismatch repair gene which results in mismatch repair deficiency in cells  
PT containing the allele is useful in gene and drug target discovery and  
PT recombinant technology.

XX Example 5; Fig 7; 25pp; English.

XX The invention relates to methods for generating a mutation in a gene of  
CC interesting using a dominant negative allele of a mismatch repair gene (D  
CC -MMR) under control of an inducible transcriptional regulatory element  
CC (ITRE). The invention is useful to provide new cell lines that can be  
CC used for gene discovery, drug target discovery, recombinant gene  
CC mutagenesis or recombinant protein production. The present sequence is a  
CC polyPNP (purine phosphorylase) out-of-frame polyA tract DNA

XX New variants of the human MLH1 and MSH2 genes for diagnosing or  
PT determining a predisposition for hereditary non-polyposis colorectal  
PT cancer.

XX Disclosure; Page 4; 38pp; English.

XX The present invention describes a variant human MLH1 or MSH2 gene. Also  
CC described are: (1) a method for diagnosing or predicting susceptibility  
CC to hereditary non-polyposis colorectal cancer (HNPCC), comprising  
CC screening a DNA sample for the variant MLH1 or MSH2 gene where presence  
CC of the variant indicates presence of, or susceptibility to HNPCC; (2) a  
CC method of identifying mutants in splice donor or acceptor sites of a  
CC human MLH1 gene, comprising sequencing splice donor or acceptor sites of  
CC the gene with intronic primers for the human MLH1 gene and analysing the  
CC sequence to identify any mutants; (3) a method of identifying mutants in  
CC splice donor or acceptor sites of a human MSH2 gene, comprising  
CC sequencing splice donor or acceptor sites of the gene with intronic  
CC primers for the human MSH2 gene and analysing the sequence to identify  
CC any mutants; and (4) a transgenic model system for colorectal cancer  
CC comprising cells expressing the variant MLH1 or MSH2 gene. The hMLH1 and  
CC hMSH2 variants are used to diagnose or determine a patient's  
CC susceptibility to hereditary non-polyposis colorectal cancer. ABL01648 to  
CC ABL01745 and ABL01746 to ABL01831 represent hMLH1 and hMSH2 gene

XX
XX Characterizing cellular activity of compound, by receiving images of
XX cells with known activity and images of cells treated with compound,
XX characterizing phenotypic attributes of images and comparing the
XX phenotypes.
```

XX Disclosure; Fig 18; 139pp; English.

XX This invention relates to a novel method for the characterisation of the

CC activity of a compound on cell. The method involves receiving images of

CC cells with a cellular activity and images of other cells treated with the

CC compound, quantitatively characterising phenotypic attributes of the

CC image of cells with a cellular activity to produce a target phenotype for

CC the cellular activity and that of the image of other cells to produce a

CC second phenotype for the compound, and comparing the two phenotypes to

CC determine whether the compound possesses cellular activity. The invention

CC may be useful for characterising cellular activity of a compound, for

CC determining information about properties of substances based upon the

CC information about structure of living or non-living cells exposed to

CC substances. The invention is also useful for identifying promising

CC candidates in a search for new and better medicines and treatments using

CC multiple biological descriptors from a single cell markers or components.

XX Analysis of cDNA and gene expression - by amplification of mRNA followed

PT by digestion with restriction enzymes.

XX Disclosure; Page 8; 11pp; Japanese.

XX A method for the analysis of cDNA comprises (a) preparing an aggregate of

CC double-stranded cDNAs by using an aggregate of mRNAs and a plural type of

CC labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798)

CC and using the aggregate of mRNAs as the template for each reverse

CC transcription primer; (b) digesting each of the prepared aggregates of

CC the double-stranded cDNAs with restriction enzyme and; (c)

CC electrophoresing the digested aggregate of cDNAs in separate lanes. The

CC method can be used to analyse gene expression rapidly and easily

XX PT Mammaglobin, secreted protein overexpressed in breast cancer.
XX PS Example 2; Page 55; 60pp; English.
XX CC The present primer was used to reverse transcribe RNA encoding a human
CC mammary-specific protein, designated mammaglobin. The specification
CC describes a protein comprising a mammaglobin antigen that is recognized
CC by B and/or Tc cells specific for the natural, secreted and glycosylated
CC form of mammaglobin polypeptide. This protein, or recombinant vectors
CC that express it, are used in vaccines for treating mammaglobin-
CC expressing cancers, specifically of the breast. Such cancers can also be
CC treated using autologous tumor lymphocytes activated ex vivo with an
CC mammaglobin antigen, then returned to the patient. Expression of
CC mammaglobin is elevated in 27% of stage I primary breast cancers, so it
CC represents a marker useful for diagnosis of this disease

XX PT Oligonucleotides inhibiting protein kinase, useful for treating diseases
XX PT such as cancer and autoimmune disease.
XX PS Example 8; Col 27-28; 26pp; English.
XX CC This invention describes novel purified aptameric oligonucleotides which
XX CC have antimicrobial, cytostatic and immunosuppressive activity. The
XX CC oligonucleotides are useful for binding to and preventing or inhibiting
XX CC the biological function of a protein kinase or a target molecule and for
XX CC detecting the presence or absence of a target molecule in biological
XX CC samples. The oligonucleotides are also useful for prophylactic and
XX CC therapeutic treatment of diseases such as cancer, autoimmune diseases and
XX CC diseases caused by pathogenic microorganisms. This sequence represents a
XX CC primer used in the method of the invention

XX PT Clusterin and gp38K-related peptide capable of altering cell migration
XX PT useful for treating atherosclerosis, cancer and stenosis following
XX PT vascular trauma or disease.
XX PS Disclosure; Page 12; 43pp; English.
XX CC The present sequence is a PCR primer for the porcine clusterin gene.
XX CC Clusterin (also known as complement cytotoxicity inhibitor, sulfated
XX CC glycoprotein-2, testosterone repressed prostate message-2, SP-40, 40 and
XX CC ApoJ) is essential for the migration of vascular smooth muscle cells
XX CC (VSMC). The gene and protein can, therefore, be used to promote wound
XX CC healing, angiogenesis and vasculogenesis, in the treatment of stenosis
XX CC following vascular trauma or disease and to treat atherosclerosis, and
XX CC antisense sequences can be used to treat cancer, as angiogenesis is vital

XX Treating prostatic tumors and renal cancers by antisense inhibition of
PT the testosterone-repressed prostate messenger-2 gene.
XX
XX Example 5; Page 38; 38pp; English.
XX
XX The present sequence is an antisense oligonucleotide directed at the
CC human testosterone-repressed prostate message-2 (TRPM-2, also known as
CC clusterin, sulfated glycoprotein-2 or SGP-2). The sequence was shown to
CC promote the regression of tumours, and oligonucleotides directed at human
CC TRPM-2 can be used in the treatment of tumour cells expressing the TRPM-2
CC gene. These include prostate cancer, renal cell cancer and some breast
CC cancer cells. In addition to this, they also increase the
CC chemosensitivity of the cells, meaning that conventional chemotherapy is
CC more effective

PT Vaccinating against tumors, infectious diseases, allergies and asthma
PT using immunostimulatory Py-rich and TG nucleic acids.
XX
PS Claim 101; Page 56; 338pp; English.
XX
CC The present invention relates to a method for stimulating an immune
CC response. The method comprises administering an immunostimulatory nucleic
CC acid to a non-rodent subject in sufficient quantity to stimulate an
CC immune response. The present sequence is one such immunostimulatory
CC nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich
CC (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects
CC against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae
CC and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma,
CC haemophilus, campylobacter, clostridium, Escherichia coli and/or
CC staphylococcus), fungal antigens and/or parasitic antigens. The method is
CC also useful for preventing cancer, asthma, infectious disease, allergy or
CC immune deficiency. The present sequence can also be used to redirect a
CC Th2 to a Th1 immune response and to activate immune cells. Note: the
CC present sequence may have a phosphorothioate backbone

PT comprises nucleic acid moieties optionally extended by a polymerase.
XX
PS Example 1; Page 10; 31pp; English.
XX
CC The specification describes branched compounds containing nucleic acid
CC moieties optionally extended by a polymerase. The branched chain
CC compounds of the invention are used in nucleic acid synthesis reaction,
CC primer extension reaction, reverse transcription reaction of RNA into
CC DNA, nucleic acid hybridization experiment (for identifying sequence of a
CC nucleic acid), and nucleic acid amplification experiment (for analysing
CC the expression pattern of genes). The compounds are also used in solid-
CC phase enzymatic reactions. The present sequence was used in the course of
CC the invention to produce branched chain compounds

 XX PT Inhibiting angiogenesis in a subject, involves administering at least one  
 XX PT antiangiogenic nucleic acid molecule to the subject.  
 XX PS Claim 2; Page 35; 276pp; English.  
 XX CC The invention relates to inhibiting angiogenesis in a subject, comprising  
 CC administering at least one antiangiogenic nucleic acid molecule. Also  
 CC included is a kit comprising a first container housing the antiangiogenic  
 CC nucleic acids, and instructions for administering them to a subject  
 CC having a condition characterised by unwanted angiogenesis. The method is  
 CC useful for inhibiting angiogenesis associated with solid tumour growth,  
 CC tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis,  
 CC diabetic retinopathy, retinopathy of prematurity, macular degeneration,  
 CC corneal graft rejection, neovascular glaucoma, retrolental fibroplasia,  
 CC rubecosis, Osler-Webber Syndrome, myocardial angiogenesis, plaque  
 CC neovascularisation, telangiectasia, haemophilic joints, angiodioma,  
 CC wound granulation, intestinal adhesions, atherosclerosis, scleroderma and  
 CC hypertrophic scars. The present sequence is an antiangiogenic nucleic  
 CC acid of the invention

XX PS Assessing condition e.g. athletic ability, stage of disease, presence of  
PT drugs, response to exercise, response to vaccines, therapies, nutritional  
PT states, of performance animal involves analyzing nucleic acid expression.  
XX Disclosure; Page 46; 87pp; English.

CC The invention relates to a method for assessing a condition of a  
CC performance animal. The method involves determining in sample abundance  
CC of expressed target nucleic acid; transmitting digital sample signal to  
CC remote diagnostic server; processing digital sample signal at remotely  
CC located database to correlate digital signal with digital information and  
CC returning report of particular condition of animal. The method is useful  
CC for assessing a condition of a performance animal preferably human, dog  
CC or camel. The condition can be an athletic ability and a condition that  
CC enhances, hinders, impedes or does not change an expected ability of the  
CC performance animal; and also normal, pre-clinical overt progress and/or  
CC stage of disease, undiagnosed or unclassified conditions, presence of  
CC states and response to exercise, response to vaccines, therapies, nutritional  
CC states and response to environmental conditions. Diseases assessed by the  
CC invention include laminitis, lameless, viral or bacterial disease,  
CC gastritis, gastric ulcers, respiratory ailments, fractures, epistaxis,  
CC musculoskeletal damage or disorders and joint diseases. The present  
CC sequence is a primer used to illustrate the method of the invention

PT prostatic cancer, inhibits the testosterone-repressed prostate message-2.  
XX  
XX Example 5; Page 40; 44pp; English.  
XX  
XX The invention relates to a compound consisting of an oligonucleotide with  
CC a phosphorothioate backbone throughout, in which: (a) sugars on  
CC nucleotide residues 1-4 and 18-21 are 2'-O-methoxyethyl modified, and the  
CC remaining nucleotides 5-17 are 2'-deoxy, and (b) the cytosines at  
CC positions 1, 4 and 19 are 5-methylated. Oligonucleotide shown in sequence  
CC ACF36398 (I) is used: (a) to delay progression of androgen-sensitive  
CC prostatic cancer cells to the androgen-independent state, in vivo or in  
CC vitro; (b) to treat prostatic cancer (after initially withdrawing  
CC androgens to induce apoptosis); and (c) to increase sensitivity of cancer  
CC cells (prostatic, renal, non-small cell lung, urothelial transitional,  
CC ovarian and some breast cancer cells) that express abnormal levels of  
CC TRPM-2 to chemotherapy or radiation. The modifications present in (I)  
CC increase stability in vivo and activity (both in vivo or in vitro) and  
CC result in a synergistic increase in effect when (I) is used with  
CC chemotherapeutic agents or other antisense oligonucleotides directed  
CC against other antiapoptotic genes. The present sequence represents an  
CC anti-apoptotic protein TRPM-2 (testosterone-repressed prostate message-2)  
CC antisense oligonucleotide

PT New modified antisense oligonucleotide, useful particularly for treating prostatic cancer, inhibits the testosterone-repressed prostate message-2.

PT

XX Example 5; Page 40; 44pp; English.

PS

XX The invention relates to a compound consisting of an oligonucleotide with a phosphorothioate backbone throughout, in which: (a) sugars on nucleotide residues 1-4 and 18-21 are 2'-O-methoxyethyl modified, and the remaining nucleotides 5-17 are 2'-deoxy; and (b) the cytosines at positions 1, 4 and 19 are 5-methylated. Oligonucleotide shown in sequence ACF36398 (I) is used: (a) to delay progression of androgen-sensitive prostatic cancer cells to the androgen-independent state, in vivo or in vitro; (b) to treat prostatic cancer (after initially withdrawing androgens to induce apoptosis); and (c) to increase sensitivity of cancer cells (prostatic, renal, non-small cell lung, urothelial transitional, ovarian and some breast cancer cells) that express abnormal levels of TRPM-2 to chemotherapy or radiation. The modifications present in (I) increase stability in vivo and activity (both in vivo or in vitro) and result in a synergistic increase in effect when (I) is used with

CC chemotherapeutic agents or other antisense oligonucleotides directed  
 CC against other antiapoptotic genes. Sequences ACF36399-406 represent  
 CC antisense oligonucleotides targeted against human anti-apoptotic protein  
 CC TRPM-2 (testosterone-repressed prostate message-2) gene

 DR Identifying at least one epigenetically silenced gene associated with  
 PT

PT cancer useful for treating cancer comprises contacting an array of genome  
PT with nucleic acid molecule that reactivates expression of epigenetically  
PS silenced gene.

XX Example 1; SEQ ID NO 27; 97pp; English.

XX This invention relates to novel methods of screening to identify  
CC epigenetically silenced genes. Specifically, it refers to the detection  
CC of epigenetically silenced tumour suppressor genes in cancer cells, which  
CC are transcriptionally inactive due to aberrant methylation at normally  
CC unmethylated CpG islands. Accordingly, these genes provide diagnostic  
CC markers for immortalised and transformed cells, and hence can be used to  
CC diagnose various proliferative disorders, particularly oesophageal cancer  
CC and head and neck cancer. The present invention describes a genomic  
CC screening method to identify silenced genes in a cell suspected of a  
CC predisposition to, or exhibiting, unregulated growth. Accordingly,  
CC oligonucleotides of the genes identified herein are useful for detecting  
CC oesophageal squamous cell carcinoma (ESCC) or neck squamous cell  
CC carcinoma. Furthermore, treatment can occur via gene therapy, using a  
CC demethylation agent such as a methyltransferase inhibitor (5Aza-dC) or a  
CC histone deacetylase inhibitor to restore expression of at least one  
CC methylation silenced gene in cancer cells. This oligonucleotide sequence  
CC is an RT-PCR primer used to amplify those genes that were up-regulated as  
CC a result of treatment with a demethylation agent i.e epigenetically  
CC silenced genes of the invention.

XX Sorting single-stranded nucleic acid, useful for analyzing expression  
PT patterns and screening active agents, uses capture agent with variable  
PT and constant regions.

PS Example; Page 5; 8pp; German.

XX This invention describes a novel method for sorting single-stranded  
CC nucleic acids by isolation and hybridisation of nucleic acid pools, then  
CC reading out, where the nucleic acids are selectively bound using capture  
CC agents that are (a) immobilised on the surface of a solid matrix and (b)  
CC comprise variable and non-variable regions. The capture oligonucleotides

CC have a 5'-invariable anchor region, the complement of which is present at  
 CC least once in each nucleic acid and a 3'-variable, discriminatory region  
 CC that comprises all possible combinations of up to 10 nucleotides to allow  
 CC binding of particular sorts of single stranded nucleic acids. The capture  
 CC agents are particularly locked nucleic acids (LNA) and the anchor region  
 CC comprises a sequence of 10-50, particularly 15-25, T residues. The  
 CC capture oligonucleotides are biotinylated and immobilised on a surface by  
 CC interaction with streptavidin. The matrix is of plastic, ceramic, glass,  
 CC metal, resin, gel, crystalline material and/or membrane, having semi-  
 CC conducting properties and especially in the form of a chip. Its surface  
 CC is particularly a layer of (bio)molecular filaments and binding of single  
 CC stranded nucleic acids to the surface is (quasi)covalent, supramolecular,  
 CC physical, stimulated by an electrical field or through a molecular sieve.  
 CC The method is used (i) for analysis of patterns, especially in mucosal,  
 CC hair root, blood, nerve or germ cells and (ii) for determining the  
 CC activity of pharmaceuticals and/or nutritional compounds, e.g. food  
 CC additives or supplements, especially minerals, trace elements, organic  
 CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and  
 CC mixtures. The method provides rapid, inexpensive and reproducible  
 CC representation of differences in pools of nucleic acids from cells. It  
 CC allows imaging of the complete pattern of all nucleic acids in a cell, and  
 CC can detect very small differences in the nucleic acid pool. Since the  
 CC method is based on comparison of nucleic acid pools, not individual  
 CC genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent  
 CC capture probes used in the method of the invention.

PT that expresses testosterone-repressed prostate message-2 (TRPM-2)

PT comprises administering a composition that inhibits expression of TRPM-2.

PT that expresses testosterone-repressed prostate message-2 (TRPM-2)

PT comprises administering a composition that inhibits expression of TRPM-2.

XX Claim 5; SEQ ID NO 5; 14pp; English.

XX The present invention provides a method for treating cancer in which

CC cancer cells express testosterone-repressed prostate message-2 (TRPM-2).

CC The invention is useful for enhancing the chemo-sensitivity or radiation-

CC sensitivity of cancer cells for treating cancer such as prostate cancer,

CC bladder cancer, ovarian cancer, lung cancer and renal cell carcinoma

CC (RCC). The invention is also useful in antisense gene therapy. The

CC present sequence is human testosterone-repressed prostate message-2 (TRPM

CC -2) antisense oligodeoxyribonucleotide (ODN).

PT that expresses testosterone-repressed prostate message-2 (TRPM-2)

PT comprises administering a composition that inhibits expression of TRPM-2.

CC oligomer is selected from locked nucleic acids (LNA), N<sup>3</sup>-PS<sup>1</sup>  
 CC phosphoramidate (NP) oligomers, minor groove binder-linked-  
 CC oligonucleotides (MGB-linked oligonucleotides), phosphorothioate (PS)  
 CC oligomers, C1-C4 alkylphosphonate oligomers, phosphoramidates, beta-  
 CC phosphodiester oligonucleotides, and alpha-phosphodiester  
 CC oligonucleotides. The C1-C4 alkylphosphonate oligomers are methyl  
 CC phosphonate (MP) oligomers. The enzymatically non-extendable nucleobase  
 CC oligomer is chimeric. The sample comprises more than one high abundance  
 CC polynucleotide. The sample comprises RNA, and polymerase extension is by  
 CC reverse transcription to yield a first strand cDNA. The method further  
 CC comprises second strand cDNA synthesis. The sample is exposed to the  
 CC nucleobase oligomer during the first and/or second strand cDNA synthesis.  
 CC The method further comprises an amplification step, which is by  
 CC polymerase chain reaction (PCR) or by in vitro transcription. The RNA is  
 CC mRNA or cRNA or total cellular RNA. Alternatively, the sample comprises  
 CC DNA, and polymerase extension is by DNA-dependent DNA polymerase in a  
 CC PCR. The method also comprises labelling the amplified polynucleotides.  
 CC The labelling is concomitant with or subsequent to amplification. The  
 CC methods are useful in selective enrichment of low abundance  
 CC polynucleotides in a sample. The pool of enriched polynucleotides may be  
 CC used in analysing gene expression and in creating cDNA libraries. The  
 CC present sequence represents a reverse transcriptase (RT)-PCR primer which  
 CC was used to amplify the human import precursor of subunit B of the H<sup>+</sup>  
 CC transporting, mitochondrial ATP synthase, subunit B, isoform 1 (ATP5F1)  
 CC gene.

XX
XX Treating melanoma in a mammalian subject comprises administering to the
XX subject a therapeutic agent effective to reduce the effective amount of
XX clusterin in the melanoma cells.
XX
XX Claim 6; SEQ ID NO 8; 32pp; English.
XX
XX The present sequence is that of an antisense oligonucleotide targeted to
XX human clusterin ADL70403. The invention relates to the treatment of
XX melanoma through reduction in the effective amount of clusterin. The
XX therapeutic agent may be an antisense oligonucleotide ADL70404-ADL70421
XX or short interfering RNA (siRNA) ADL70422-ADL70445 targeted to clusterin.
XX The antisense oligonucleotides are complementary to a region of the
XX clusterin mRNA spanning either the translation initiation site or the
XX termination site. They may be modified to increase stability in vivo,
XX e.g. they may be employed as phosphorothioate derivatives and may have 2',
XX -O-(2-methoxyethyl) modifications in the 5' and 3' 'wings'. A method for
XX regulating expression of bcl-xL in a subject or cell line comprises
XX administering an agent effective to modulate the amount of clusterin
XX expression. In clusterin-expressing cells, expression of bcl-xL is down-
XX regulated when the effective amount of clusterin is reduced. Such
XX inhibition is significant because bcl-xL is known to act as an inhibitor
XX of apoptosis.

XX Treating melanoma in a mammalian subject comprises administering to the
XX subject a therapeutic agent effective to reduce the effective amount of
XX clusterin in the melanoma cells.
XX Claim 6; SEQ ID NO 10; 32pp; English.
XX The present sequence is that of an antisense oligonucleotide targeted to
XX human clusterin ADL70403. The invention relates to the treatment of
XX melanoma through reduction in the effective amount of clusterin. The
XX therapeutic agent may be an antisense oligonucleotide ADL70404-ADL70421
XX or short interfering RNA (siRNA) ADL70422-ADL70445 targeted to clusterin.
XX The antisense oligonucleotides are complementary to a region of the
XX clusterin mRNA spanning either the translation initiation site or the
XX termination site. They may be modified to increase stability in vivo,
XX e.g. they may be employed as phosphorothioate derivatives and may have 2'
XX -O-(2-methoxyethyl) modifications in the 5' and 3' 'wings'. A method for
XX administering an agent effective to modulate the amount of clusterin
XX expression. In clusterin-expressing cells, expression of bcl-xL is down-
XX regulated when the effective amount of clusterin is reduced. Such
XX inhibition is significant because bcl-xL is known to act as an inhibitor
XX of apoptosis.

XX Treating melanoma in a mammalian subject comprises administering to the

XX subject a therapeutic agent effective to reduce the effective amount of

XX clusterin in the melanoma cells.

XX Claim 7; SEQ ID NO 4; 32pp; English.

CC The present sequence is that of an antisense oligonucleotide targeted to  
 CC human clusterin ADL70403. The invention relates to the treatment of  
 CC melanoma through reduction in the effective amount of clusterin. The  
 CC therapeutic agent may be an antisense oligonucleotide ADL70404-ADL70421  
 CC or short interfering RNA (siRNA) ADL70422-ADL70445 targeted to clusterin.  
 CC The antisense oligonucleotides are complementary to a region of the  
 CC clusterin mRNA spanning either the translation initiation site or the  
 CC termination site. They may be modified to increase stability in vivo,  
 CC e.g. they may be employed as phosphorothioate derivatives and may have 2'  
 CC -O-(2-methoxyethyl) (MOE) modifications in the 5' and 3' 'wings'. The  
 CC present antisense oligonucleotide is particularly preferred. It is  
 CC targeted to the translation initiation codon and next 6 codons of the  
 CC human clusterin sequence. It has a phosphorothioate backbone throughout  
 CC and MOE wings, the remaining nucleotides being 2'-deoxynucleotides. In an  
 CC example from the invention, this antisense oligonucleotide provided a  
 CC dose-dependent down-regulation of clusterin in human melanoma cells,  
 CC leading to an increase in apoptotic cell death. In one melanoma cell line  
 CC (607B) this alone was sufficient to lead to complete cell death. In  
 CC another melanoma cell line, the surviving cells showed increased  
 CC sensitivity to subsequent treatment with cisplatin. A claimed method for  
 CC regulating expression of bcl-xL in a subject or cell line comprises  
 CC administering an agent effective to modulate the amount of clusterin  
 CC expression. In clusterin-expressing cells, expression of bcl-xL is down-  
 CC regulated when the effective amount of clusterin is reduced. Such  
 CC inhibition is significant because bcl-xL is known to act as an inhibitor  
 CC of apoptosis.

 PT Treating melanoma in a mammalian subject comprises administering to the  
 PT subject a therapeutic agent effective to reduce the effective amount of  
 PT clusterin in the melanoma cells.  
 XX  
 PS Claim 6; SEQ ID NO 12; 32pp; English.  
 XX  
 CC The present sequence is that of an antisense oligonucleotide targeted to  
 CC human clusterin ADL70403. The invention relates to the treatment of  
 CC melanoma through reduction in the effective amount of clusterin. The  
 CC therapeutic agent may be an antisense oligonucleotide ADL70404-ADL70421  
 CC or short interfering RNA (siRNA) ADL70422-ADL70445 targeted to clusterin.  
 CC The antisense oligonucleotides are complementary to a region of the  
 CC clusterin mRNA spanning either the translation initiation site or the  
 CC termination site. They may be modified to increase stability in vivo,  
 CC e.g. they may be employed as phosphorothioate derivatives and may have 2'  
 CC -O-(2-methoxyethyl) modifications in the 5' and 3' 'wings'. A method for  
 CC regulating expression of bcl-xL in a subject or cell line comprises  
 CC administering an agent effective to modulate the amount of clusterin  
 CC expression. In clusterin-expressing cells, expression of bcl-xL is down-  
 CC regulated when the effective amount of clusterin is reduced. Such  
 CC inhibition is significant because bcl-xL is known to act as an inhibitor  
 CC of apoptosis.

XX Synthesizing double-stranded cDNA, by synthesizing a cDNA strand from RNA  
 PT template, removing the template and synthesizing double-stranded cDNAs  
 PT using the cDNA as template in the presence of processive DNA polymerase  
 PT and random primers.

XX Example 1; SEQ ID NO 2; 19pp; English.

XX The present invention relates to a method for synthesizing double-  
 CC stranded cDNA, by synthesizing first cDNA strands in a first reaction  
 CC mixture comprising reverse transcriptase, RNA template, and first strand  
 CC primer complementary to template, removing the template, synthesizing  
 CC double-stranded cDNAs in a second reaction mixture comprising processive  
 CC DNA polymerase, DNA ligase, first cDNA strand as template and random  
 CC primers having a mixture of oligonucleotides having random DNA sequences.  
 CC Also disclosed is a method for amplifying a population of RNA molecules  
 CC to produce a pool of double-stranded cDNA molecules, and a kit for  
 CC synthesizing double-stranded cDNA. The generated cDNA products are useful  
 CC in determining quantitative information about the genetic profile of  
 CC nucleic acid in original RNA sample. The method of the invention is  
 CC useful in differential gene expression assays for the analysis of  
 CC diseased and normal tissue and for large-scale correlation studies on  
 CC sequences, mutations, variants or polymorphisms among samples. The method  
 CC is efficient in synthesizing improved cDNA molecules and effective in  
 CC generating useful quantities of an amplified cDNA product that comprises  
 CC a population of cDNA molecules in substantially the same relative molar

CC ratio as the RNA or mRNA starting material. The present sequence  
 CC represents a primer used for cDNA first strand synthesis.

XX New oligomers contg. modified bases - which form a triplex with G-C  
 PT doublet in a DNA duplex, for treating and diagnosing HIV, hepatitis,  
 PT herpes malignancy and inflammation.

XX Claim 12; Page 71; 77pp; English.

CC The synthetic oligomer is capable of forming a triplex at physiological  
 CC pH with a purine rich target sequence by coupling into the major groove  
 CC of the duplex. The specific target sequence of this oligomer is the human  
 CC interleukin 6 gene untranslated sequence contg. a purine rich sequence  
 CC concd. on one strand of the duplex. The oligomer, and others like it are  
 CC useful in diagnosis and therapy of diseases characterised by specific DNA  
 CC duplex targets, e.g. HPV, HER, HIV, hepatitis B, herpes, malignant  
 CC tumours and inflammation. The triple helices form under mild conditions  
 CC thus assays may be carried out without subjecting the test specimen to  
 CC harsh conditions. The oligomer contains an inverted polarity region  
 CC formed from an o-xyloso dimer synthon. The linking gp. is o-xyloso  
 CC (nucleotides have the 3' positions of xylose sugars linked via the o-  
 CC xylene ring). Two nucleotides are coupled through a xylene residue to  
 CC form the dimer synthon. This additional modifications may render the  
 CC oligomer stable to nuclease activity. The oligomer is able to inhibit  
 CC gene expression, as verified by in vitro systems. See also AAQ25452-25501  
 CC and AAQ30226-448. (Updated on 25-MAR-2003 to correct PN field.)

XX Identifying lung cancer/metastasis of solid tumor in patient by isolating  
PT blood or non-lung tissue, or bone marrow from patient and identifying  
PT presence of marker e.g. syndecan 1, collagen 1 alpha 2, 7013, or 7018.  
XX  
PS Example 1; Page 6; 29pp; English.

CC The sequences given in AAI72265-69 are oligonucleotides which were used  
CC in the method of the invention for identifying lung cancer or metastasis  
CC of a solid tumour. The method comprises isolating blood (or non-lung  
CC tissue in the case of identifying lung cancer, or bone marrow in case of  
CC identifying metastasis) from a patient, and identifying the presence of  
CC at least one marker (M) such as syndecan 1, collagen 1 alpha 2, 7013, or  
CC 7018. These oligos lead to the amplification of cDNA's which were more  
CC abundant in lung cancer RNA than in normal blood. The method is useful  
CC for identifying lung cancer in a mammal e.g., human, dog or cat, and  
CC identifying metastasis of solid tumour in a patient, where the solid  
CC tumour is of bile duct, colon, breast, uterus, oesophagus or larynx. The  
CC method is useful for identifying presence of lung cancer cells in the  
CC blood or bone marrow, and also for identifying metastasis and thus for  
CC identifying lung cancer cells in an organ such as liver or brain. The  
CC method is useful to identify the presence of lung cancer cells at a very

CC early stage in the disease, or after remission or to identify a relapse

XX New radiation hybrid map of the dog, Canine familiaris, genome, useful  
PT for e.g. identifying genes implicated in phenotypic and behavioral traits  
PT or in genetic diseases and for studying dog pedigrees.  
XX  
PS Claim 1; Page 61; 87pp; English.

CC The present invention describes a radiation hybrid map of the dog (Canine  
CC familiaris) genome comprising the genome location of a marker selected  
CC from AAA66139 to AAA66942. The radiation hybrid map is useful for  
CC identifying and localising dog genes, since it covers approximately 80 %  
CC of the dog genome and provides a dense map integrating different types  
CC (i.e. Type I and Type II) of markers. The map and the dog genome markers  
CC (or complementary sequences) are especially useful to identify genes  
CC responsible for phenotypic and behavioural traits in dogs, to identify  
CC morbid genes, to analyse diseases and identify implicated genes in such  
CC diseases and their alleles, and to study dog pedigrees. They may also be  
CC useful for isolating corresponding human gene sequences e.g. genes  
CC involved in genetic diseases

XX	
CC	The invention relates to human phosphatase 79 (AAH24266), nucleic acids encoding it (AAH24264), and a method for the recombinant production of human phosphatase 79. The present invention additionally discloses an agonist of phosphatase 79 for therapeutic use, and an antibody which specifically binds to human phosphatase 79. Human phosphatase 79, and nucleotides which encode it may be used for treating a variety of diseases, such as malignant tumours, blood diseases, HIV (human immunodeficiency virus) infection, immune disorders and inflammatory conditions. The protein may also be used to screen for modulators of its activity or for peptide fingerprinting identification. The polynucleotide can be used as a primer for nucleic acid amplification reaction or as a probe for hybridisation reactions, or in producing gene chips or microarrays. Sequences AAH24265-AAH24266 represent reverse transcription-PCR (RT-PCR) primers used in an exemplification of the invention to isolate human phosphatase 79 cDNA

PT identifying mRNAs expressed at different levels, comprises employing an  
PT identifier having a oligo-dT primer of a specific sequence and a  
XX detectable marker at its 5' end.  
PS Disclosure; Page 11; 45pp; English.  
XX  
CC The invention relates to systems for identification and characterisation  
CC of gene expression in one or more samples, comprising an identifier having  
CC a specific oligo-dT primer sequence, where the identifier comprises a  
CC detectable marker at its 5' end. The system is useful for identifying any  
CC or all genes expressed in a given in vivo or in vitro RNA sample, as well  
CC as the relative differences in mRNA between 2 or more samples, where  
CC desired, for supporting discovery of new genes, and for identifying mRNAs  
CC that are expressed at different levels between 2 or more samples. The new  
CC system or method addresses limitations of prior methods by comprising  
CC or biochemical assay compositions and systems are linked to DNA or RNA  
CC sequence databases for optimal resource efficiency in assaying gene  
CC expression. The system has the following advantages over existing  
CC methods: (a) prior sequence information or clone library construction is  
CC not needed to enable the assay; (b) provides immediate sequence  
CC information in addition to information concerning changes or differences  
CC in mRNA level; (c) determines mRNA expression level and mRNA identification  
CC in one assay; (d) does not require prior knowledge of the sequence of  
CC sample for subsequent investigation by common molecular biology  
CC techniques; and (d) does not require prior knowledge of the sequence of  
CC the genome of the organism under investigation and can be employed in  
CC organisms lacking significant genomic sequence in formation. The present  
CC sequence represents an oligo dT primer used in the method of the  
CC invention

PT New immunostimulatory oligonucleotide comprising non-palindromic nucleic

PT acid sequence motif, useful for inducing B-cell activation, treating,  
 PT preventing or ameliorating immune system disorder or tumoral disease e.g.  
 XX melanoma.

PS Claim 14; SEQ ID NO 21; 139pp; English.

XX This invention relates to novel immunostimulatory oligonucleotides that  
 CC contain a non-palindromic sequence motif. Specifically, it refers to DNA  
 CC oligonucleotides (without a CpG motif), which can stimulate an immune  
 CC response in animals of the order of primates, including humans. The immune  
 CC response is characterised by the proliferation, differentiation, cytokine  
 CC and antibody production in B-cells, as well as cell differentiation and  
 CC cytokine production in plasmacytoid dendritic cells. The present  
 CC invention describes immunomodulator compositions that also comprise an  
 CC antigen selected from, for example, viruses, bacteria, parasites, tumour  
 CC cells and glycolipids. As such, these DNA oligos can be used in gene  
 CC therapy for inducing B-cell activation, treating, preventing or  
 CC ameliorating an immune system disorder or a tumoral disease including  
 CC chronic myelogenous leukaemia, melanoma, Kaposi's sarcoma, and renal cell  
 CC carcinoma. This oligonucleotide sequence is an immunostimulatory non-CpG  
 CC variant DNA oligo, used in an exemplification of the invention.

XX Generating mutation in gene using cells which contain defective mismatch

PT repair gene, useful to generate genetically altered mutations with new  
PT output traits.  
XX  
PS Example 5; Fig 7; 59pp; English.  
XX  
CC The patent discloses a method for generating hypermutable organisms.  
CC Dominant negative alleles of human mismatch repair genes can be used to  
CC generate hypermutable cells and organisms. They increase the rate of  
CC spontaneous mutations by reducing the effectiveness of DNA repair and  
CC thereby render the cells or animals hypermutable. The method is used to  
CC produce genetically altered organisms to produce new output traits. The  
CC present sequence is a bacterial poly purine nucleotide phosphorylase  
CC (polyPNP) DNA fragment containing an in-frame polyA tract. This sequence  
CC is used in the exemplification of the invention

PT Novel intercalator, useful as electrochemical double stranded DNA  
PT detection reagent.  
XX  
PS Example 1; Page 23; 24pp; Japanese.  
XX  
CC The invention relates to a novel intercalator having a specific formula.  
CC The intercalator of the invention may be useful for the electrochemical  
CC detection of a gene, as an electrochemical double stranded DNA detection  
CC reagent and as an intercalator for inhibiting the influence of mismatch  
CC DNA and single stranded DNA. The intercalator enables the transmission of  
CC electronic transistion between two base pairs to occur efficiently. The  
CC current sequence is that of the electrochemical detection intercalator-  
CC related DNA 1 of the invention.

PT Producing a molecular array with a plurality of molecules immobilized to  
PT a solid substrate, useful in genetic analysis, gene expression studies or  
PT the detection or typing of single nucleotide polymorphisms in a sample of  
PT nucleic acids.  
XX  
PS Example 15; Page 122; 166pp; English.  
XX  
CC The invention comprises a method for producing a molecular array, the  
CC method involves immobilising molecules to a solid phase at a density  
CC which allows individual immobilised molecules to be individually  
CC resolved. The molecular array produced by the method of the invention is  
CC useful for identifying one or more target molecules in a sample. The  
CC molecular array is also useful in genetic analysis, gene expression  
CC studies, identifying molecules which interact with a target molecule,  
CC detection/typing of single nucleotide polymorphisms, haplotyping and  
CC sequencing. The present DNA sequence represents a PCR primer that was  
CC used in an example of the invention

XX Novel nucleic acid comprising a locked nucleic acid unit having a  
 PT modified base that comprises an optionally substituted carbocyclic aryl  
 PT moiety, or modified nucleobase or nucleosidic base other than  
 PT oxazole/imidazole.  
 XX Example 24a; Page 90; 119pp; English.  
 PS  
 CC The present sequence is that of pyrene-anchored locked nucleic acid (LNA)  
 CC oligo(dT) primer ON14, which was used in first-strand cDNA synthesis from  
 CC eukaryotic mRNA. It includes compound '17d' at its 3' end, which is based  
 CC on an LNA-type 2'-O,4'-C-methylene-beta-D-ribofuranosyl moiety. It is  
 CC one of a set of such primers (see also ACC48482-85) that were used in an  
 CC example from the invention to demonstrate improved reverse transcription  
 CC of mRNA using pyrene-LNA anchored oligo(T) primers. The following results  
 CC were observed: efficient priming on mRNAs with short poly(A) tails;  
 CC efficient anchoring of the oligo(T) primer by pyrene-LNA and LNA-C/G/T  
 CC units resulting in an improved T20-VN anchor primer and thus avoiding  
 CC reverse transcription of long poly(A) tracts; and improved reverse  
 CC transcription of eukaryotic poly(A)+RNA directly from total RNA extracts  
 CC due to increased specificity. The invention relates to modified LNA units  
 CC that comprise unique base groups. Desirable nucleobase and nucleosidic  
 CC base substitutions can mediate universal hybridisation when incorporated  
 CC into nucleic acid strands. The novel LNA compounds can be used e.g. as  
 CC PCR primers, in sequencing, the synthesis of antisense oligonucleotides,  
 CC and in diagnostics

XX New microarray, comprising a matrix of cDNA probe from a set of probes

PT immobilized to a solid surface in predetermined order, useful in the

PT prognosis of patients with clear cell renal carcinoma.

XX

PS Example 2; Page 30; 179pp; English.

CC The present invention relates to a microarray comprising a matrix of at

CC least one cDNA probe from a set of probes immobilised to a solid surface

CC in a predetermined order, where a row of pixels corresponds to replicates

CC of one distinct probe from the set. The probes are complementary to

CC nucleic acid sequences that are expressed differentially in aggressive as

CC compared to non-aggressive types of clear cell renal carcinoma (CC-RCC)

CC and that hybridise to the probes under high stringency conditions. The

CC microarray is useful for the prognosis of patients with CC-RCC, wherein

CC aggressive and non-aggressive CC-RCC tumour types are characterised by

CC differential expression profiles of genes that hybridise with one or more

CC probes immobilised on the microarray. The arrays are useful for gene

CC expression profiling of tumour and normal tissues. The present sequence

CC represents an oligo-dT primer used in the examples of the present

CC invention

DR

XX Selecting genes expressed in cancer cell, by characterizing cancer based

PT on functioning of gene selection by comparing expression of selected gene

PT from cancer cell with expression of selected genes from noncancerous

PT cell.

XX

XX Example 2; Page 18; 53pp; English.

PS

XX

CC The invention relates to a method of selecting genes expressed in a

CC cancer cell, which involves characterising cancer based on the

CC functioning of gene selection by comparing the expression of the selected

CC gene from the cancer cell with the expression of an identical selection

CC of genes from a noncancerous cell or different type of cancer cell. The

CC method is useful for selecting genes expressed in a cancer cell. The

CC method is useful for targeting the therapy of cancer by using a selection

CC of genes or their products expressed in a cancer cell, the gene selection

CC comparing the expression of the selected gene or their products from the

CC cancer cell with the expression of an identical selection of genes or

CC their products noncancerous. The method is also useful for diagnosing,

CC prognosing, monitoring and classifying a disease condition e.g. cancer

CC such as neuroblastoma, rhabdomyosarcoma, Burkitt's or Ewing family of

CC tumours. The present sequence represents an anchored oligonucleotide

CC primer used to extract RNA from cells.

PT Producing molecular array by immobilizing to solid phase several known to

PT molecules at low density for allowing individual immobilized molecules to

PT be individually resolved and spatially addressable.

XX

XX Disclosure; Page 152; 219pp; English.

PS

XX The invention relates to a method of producing (M1) a molecular array,

CC involves: immobilizing to a solid phase a several molecules at a density

CC which allows individual immobilized molecules to be individually

CC resolved, where each molecule in the array is spatially addressable and

CC the identity of each molecule is known or determined prior to

CC immobilization; and optionally providing a molecular array comprising a

CC several molecules immobilized to a solid phase at a density such that

CC individual immobilized molecules are not capable of being individual

CC resolved, and reducing the density of functional immobilized molecules in

CC the array such that remaining individual functional immobilized molecules

CC are capable of being individually resolved, where each individual  
 CC functional molecule in the resulting array is spatially addressable and  
 CC the identity of each molecule is known or determined prior to the density  
 CC reduction step. The array efficiently resolve complex samples, separate  
 CC correct signals from erroneous signals, eliminates need for sample  
 CC amplification, detects transient interactions or temporal characteristic  
 CC of single molecule processes. This sequence represents anoligonucleotide  
 CC used in the method of the invention.

 PT Novel mutant of PON enzyme exhibiting increased substrate specificity to  
 PT PON substrate, useful for treating or preventing PON1-related diseases  
 PT e.g., hyperlipidemia, atherosclerosis, neurological disease or cancer.  
 XX  
 PS Example 1; SEQ ID NO 11; 240pp; English.  
 XX

CC This invention relates to novel mutant serum paraoxonase (PON1) nucleic  
 CC acid molecules and the encoded proteins thereof. Specifically, it refers  
 CC to enzymes that are calcium dependent phosphotriesterases essential to  
 CC the detoxification process of organophosphates such as the insecticide  
 CC paraoxon and the nerve agents sarin and soman. The present invention  
 CC describes a method to identify mutated PONs that exhibit substantially  
 CC identical (or improved) substrate specificity in comparison with the wild  
 CC -type PON and also those mutants that do not form aggregates when  
 CC expressed in bacteria. In particular, the method employed an in vitro  
 CC evolution process to identify proteins with desired traits such as  
 CC structural plasticity, catalytic activity and maintaining substrate

CC binding. These mutants have been found to be useful for treating or  
 CC preventing PON1-related diseases including hyperlipidaemia, or  
 CC atherosclerosis, neurological disease (e.g. Alzheimer's disease,  
 CC neurofibromatosis, Huntington's disease, depression, amyotrophic lateral  
 CC sclerosis, multiple sclerosis, cancer and organophosphate poisoning. Accordingly,  
 CC they exhibit antilipaeamic, cancer and organophosphate poisoning. Accordingly,  
 CC they exhibit antilipaeamic, cancer and organophosphate poisoning. Accordingly,  
 CC neurotropic, cytostatic, anticonvulsant, antidepressant and  
 CC antiparkinsonian activities, as well as being an antidote in a case of  
 CC poisoning. This oligonucleotide sequence is a PCR primer used for the  
 CC cloning and expression of a wild type PON1 gene of the invention.

 PS Example 2; Page 45; 67pp; English.  
 XX

CC The present invention relates to a method for providing a profile of mRNA  
 CC molecules present in a sample. The method comprises generating two  
 CC independent patterns characteristic of the population of mRNA molecules  
 CC expressed in the sample and analysing the patterns using a combinatorial  
 CC algorithm, comparing gene expression by different or same cell types  
 CC under different conditions, and identifying genes having a role in  
 CC various cellular processes. The method is useful for the analysis and  
 CC identification of transcribed genes, and fingerprinting. The method can  
 CC be used to identify genes which play a role in determining various  
 CC cellular processes, including susceptibility to external factors,  
 CC development, and disease. The present sequence for a PCR primer is used  
 CC in the methods of the present invention

XX PT Identifying and characterizing gene expression in samples, for
PT identifying mRNAs expressed at different levels, comprises employing an
PT identifier having an oligo-dT primer of a specific sequence and a
PT detectable marker at its 5' end.
XX PS Example 1; Page 15; 45pp; English.
XX CC The invention relates to systems for identification and characterisation
CC of gene expression in one or more samples, comprising an identifier having
CC a specific oligo-dT primer sequence, where the identifier comprises a
CC detectable marker at its 5' end. The system is useful for identifying any
CC or all genes expressed in a given in vivo or in vitro RNA sample, as well
CC as the relative differences in mRNA between 2 or more samples, where
CC desired, for supporting discovery of new genes, and for identifying mRNAs
CC that are expressed at different levels between 2 or more samples. The new
CC system or method addresses limitations of prior methods by comprising
CC compositions and systems that incorporate new strategies where molecular
CC or biochemical assay compositions and systems are linked to DNA or RNA
CC sequence databases for optimal resource efficiency in assaying gene
CC expression. The system has the following advantages over existing
CC methods: (a) prior sequence information or clone library construction is
CC not needed to enable the assay; (b) provides immediate sequence
CC information in addition to information concerning changes or differences
CC in mRNA level, to determine mRNA expression level and mRNA identification
CC in one assay; (c) generates cDNA fragments from all mRNAs present in the
CC sample for subsequent investigation by common molecular biology
CC techniques; and (d) does not require prior knowledge of the sequence of
CC the genome of the organism under investigation and can be employed in
CC organisms lacking significant genomic sequence information. The present
CC sequence represents an oligo dT primer used in the method of the
XX invention

XX PT Typing genes that contain polymorphic microsatellite loci, useful for
PT identifying predisposition to disease, by amplification and determining
PT length of amplicons.
XX PS Example 3; Page 28; 64pp; German.
XX CC The invention describes a method of typing (M1) a gene (I) that has one
CC or more polymorphic microsatellite loci (PML). The method comprises: PCR
CC amplification of at least one DNA region of (I) that includes PML, using
CC as template a DNA sample containing at least one segment of (I); and
CC determining the length of the resulting amplicon(s). Also described are:
CC a method of determining (M2) microsatellite markers (NM) for
CC predisposition to a disease, associated with a gene that includes one or
CC more PML; and prediagnosis (M3) of diseases associated with gene that
CC include PML. The method is used to identify microsatellite markers, in a
CC disease-related gene, that are associated with a predisposition to
CC diseases and for prediagnosis of such diseases, especially prion diseases
CC but also cystic fibrosis, malignant hyperthermia syndrome in pigs and
CC metabolic diseases; also to type genes that encode milk proteins,
CC hormones or transcription factors. The method is simpler, quicker and
CC particularly less expensive than known methods based on sequencing. This
CC sequence represents a primer used to genotype a region of the cow prion
XX protein (Prp) comprising a polymorphic microsatellite locus.

PT Polymorphic bovine DNA markers - used in genetic identification, gene
PT mapping, and selective breeding.
XX
PS Table 7; Page 150; 517pp; English.
XX
CC The sequence is that of a bovine microsatellite sequence obtd. by
CC screening a library of bovine MboI DNA fragments of between 250 and 500
CC bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
CC clones cross-hybridised. Assuming independent distribution of
CC microsatellites and MboI sites, the frequency of (76)n > 9 microsatellites
CC in the bovine genome is estimated at >100, 000. The sequence information
CC for ca. 230 such bovine microsatellites is summarised in the
CC specification and indexed herein (see below). The sequences upstream and
CC downstream of the microsatellite sequence were used to generate the
CC required PCR primers for in vitro amplification of the corresp.
CC microsatellite (using the program OPIPRIM). The microsatellites may be
CC used to identify individuals, for parentage testing, and in the genetic
CC mapping of economic trait loci, or genes involved the determinism of
CC economically important traits esp. in cattle, to allow selective
CC breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

XX
PT Assay device for hapten or its specific antibodies - comprises support
PT having competitive reagent immobilised via nucleic acid ligand to improve
PT orientation and accessibility.
XX

```

```

XX PS Example 1; Page 10; 39pp; French.
XX CC Oligonucleotides (AAQ94201-Q94205) were synthesised for use as ligands.
XX CC The ligands are covalently linked to a hapten (esp. a steroid hormone) to
XX CC form a conjugate which is then immobilised on a solid support for
XX CC interaction with antibodies against the hapten. Nucleic acid ligands are
XX CC less likely to be recognised by the antibodies than are peptide ligands
XX CC and nucleic acids are also less likely to undergo intramolecular
XX CC organisation which interferes with accessibility of the hapten to the
XX CC antibodies. For immunodiagnosis of oestradiol, the active hapten
XX CC oestradiol-6-carboxymethoxime-N-hydroxysuccinimide ester was used.
XX CC (Updated on 25-MAR-2003 to correct PN field.)

PT Mycobacterium vaccae polypeptides - used to develop products for use in
PT detection, therapy and prevention of mycobacteria infections or as immune
PT response enhancers.
XX
PS Example 8; Page 99; 153pp; English.
XX
CC This oligonucleotide is used in the DNA cloning strategies of the
CC Mycobacterium vaccae antigens. The invention provides M. vaccae
CC polypeptides that comprise an immunogenic portion of a soluble M. vaccae
CC antigen, or a variant, where the antigen induces an immune response in
CC patients previously exposed to a mycobacterium. Such M. vaccae
CC polypeptides can be used in methods for enhancing non-specific immune
CC response. The methods and products can be used for the detection,
CC treatment and prevention of infectious diseases caused by mycobacteria
CC such as M. vaccae, M. avium or M. tuberculosis. The products also have
CC the ability to induce cell proliferation and cytokine production (e.g.
CC interferon-gamma and interleukin-12 production) in T cells, NK cells, B
CC cells, or macrophages. They can be used for enhancing immune responses
CC for use in vaccines or immunotherapy of infectious diseases and cancers

XX The invention provides heat-killed *Mycobacterium vaccae*, or recombinant  
 CC *M. vaccae* proteins. The *M. vaccae* proteins may be employed to activate T  
 CC cells and natural killer cells, to stimulate the production of cytokines,  
 CC to enhance the expression of co-stimulatory molecules on dendritic cells  
 CC and monocytes, and to enhance dendritic cell maturation and function. The  
 CC proteins can be expressed by standard recombinant methodology.  
 CC Pharmaceutical compositions comprising the proteins or nucleic acid  
 CC sequences encoding the proteins can be used for the treatment,  
 CC prevention, and detection of disorders including infectious diseases,  
 CC immune disorders and cancer. In particular, the compounds and methods are  
 CC used for treatment of diseases of the respiratory system, such as  
 CC mycobacterial infections, asthma, allergies, tuberculosis, leprosy,  
 CC sarcoidosis and lung cancers, and disorders of the skin such as  
 CC psoriasis, atopic dermatitis, eczema, allergic contact dermatitis,  
 CC alopecia areata, and skin cancers such as basal carcinoma, squamous cell  
 CC carcinoma and melanoma

Quantitative analysis of a biochemical compound such as glucose, in body  
 a body fluid such as blood, comprising detecting enhanced electron  
 transfer between an oxidase and a DNA-immobilized electrode, useful for  
 diagnosis of disease.  
 Example 1; Page 8; 14pp; English.  
 This invention describes a novel method for quantitatively analysing a  
 biochemical compound (I) which comprises contacting (I) with double  
 stranded DNA fixed to the surface of an electrode at their terminals in  
 which electrochemically active threading intercalators are intercalated,  
 in an aqueous medium under application of electric potential to the  
 electrode in the presence of an oxidase which oxidizes the biochemical  
 compound and becomes reduced, and detecting electric current flowing  
 between the electrode and a second electrode in the aqueous medium. The  
 method is useful for detection of biochemical compounds such as glucose,  
 cholesterol, urea nitrogen, bilirubin, uric acid, haemoglobin and lactic  
 acid in body fluids such as whole blood, plasma, serum, urine, and lymph  
 for diagnosis of various diseases. The method allows detection of  
 biochemical compounds quickly and easily with a high sensitivity using a  
 simple apparatus. This sequence represents DNA fragment used as fixed  
 electrode in the presence of an oxidase which oxidizes the biochemical

CC compound and becomes reduced, and detecting electric current flowing  
 CC between the electrode and a second electrode in the aqueous medium. The  
 CC method is useful for detection of biochemical compounds such as glucose,  
 CC cholesterol, urea nitrogen, bilirubin, uric acid, haemoglobin and lactic  
 CC acid in body fluids such as whole blood, plasma, serum, urine, and lymph  
 CC for diagnosis of various diseases. The method allows detection of  
 CC biochemical compounds quickly and easily with a high sensitivity using a  
 CC simple apparatus. This sequence represents DNA fragment used as a target  
 CC sample in the method of the invention

PT functional modifiers, immunostimulatory DNA binding competitors and to
PT optimize immunostimulatory oligodeoxynucleotides for stimulation.
XX
XX Example 1; Page 45; 95pp; English.
PS
XX The invention relates to the use of an immunostimulatory single-stranded
CC DNA-binding protein in screening assays to identify compounds which bind
CC to it and thereby act as functional modifiers of immunostimulatory
CC oligodeoxynucleotide (ODN) activity. Such modifiers of ODN activity
CC consist of immunostimulatory DNA binding inhibitors, immunostimulatory
CC DNA mimics, and immunostimulatory DNA agonists and antagonists.
CC Immunostimulatory DNA-binding proteins can also be used in screening
CC methods to identify immunostimulatory DNA binding competitors, and to
CC optimize an immunostimulatory ODN for immune stimulation. Isolated
CC complexes of an immunostimulatory DNA-binding protein bound to an
CC immunostimulatory ODN can additionally be used to screen a panel of
CC candidate target molecules to identify the cellular target molecules of
CC the immunostimulatory ODN. The immunostimulatory DNA-binding proteins
CC used in the methods of the invention are the RNA-binding proteins
CC nucleolin, hnrnp D, AUF1, hnrnp A1 and lupus La protein. The screening
CC methods are useful for identifying a compound that inhibits interaction
CC between immunostimulatory DNA and an immunostimulatory DNA-binding
CC protein and for identifying agonists useful in immunotherapy. The complex
CC is useful in screening for immunostimulatory DNA cellular target
CC molecules. The candidate immunostimulatory ODN competitors allow the
CC investigation of structure/activity relationships of immunostimulatory
CC DNA-binding proteins and immunostimulatory ODNs. The present sequence
CC represents an oligonucleotide used in an exemplification of the invention

PT optimize immunostimulatory oligodeoxynucleotides for stimulation.  
XX  
PS Example 1; Page 45; 95pp; English.  
XX  
CC The invention relates to the use of an immunostimulatory single-stranded  
CC DNA-binding protein in screening assays to identify compounds which bind  
CC to it and thereby act as functional modifiers of immunostimulatory  
CC oligodeoxynucleotide (ODN) activity. Such modifiers of ODN activity  
CC consist of immunostimulatory DNA binding inhibitors, immunostimulatory  
CC DNA mimics, and immunostimulatory DNA binding agonists and antagonists.  
CC Immunostimulatory DNA-binding proteins can also be used in screening  
CC methods to identify immunostimulatory DNA binding competitors, and to  
CC optimize an immunostimulatory ODN for immune stimulation. Isolated  
CC complexes of an immunostimulatory ODN for immune stimulation bound to an  
CC immunostimulatory ODN can additionally be used to screen a panel of  
CC candidate target molecules to identify the cellular target molecules of  
CC the immunostimulatory ODN. The immunostimulatory DNA-binding proteins  
CC nucleolin, hnRNP A1, AUF1, hnRNP D and lupus La protein. The screening  
CC methods are useful for identifying a compound that inhibits interaction  
CC between immunostimulatory DNA and an immunostimulatory DNA-binding  
CC protein and for identifying agonists useful in immunotherapy. The complex  
CC is useful in screening for immunostimulatory DNA cellular target  
CC molecules. The candidate immunostimulatory ODN competitors allow the  
CC investigation of structure/activity relationships of immunostimulatory  
CC DNA-binding proteins and immunostimulatory ODNs. The present sequence  
CC represents an oligonucleotide used in an exemplification of the invention

PT Modifying a 3' terminus of a pre-selected DNA sequence, useful for  
PT labeling and modifying 3'-termini of other nucleic acids, comprises using  
PT a synthetic nucleotide template with a defined overhang nucleotide.  
XX  
PS Example 5; Col 13; 22pp; English.  
XX  
CC The sequence represents a synthetic DNA template molecule used to  
CC demonstrate the method of the invention. The invention relates to a  
CC method of modifying (e.g. 3' end labelling with 32P dATP) the 3' terminus  
CC of an RNA molecule by providing a DNA oligonucleotide, complementary to  
CC the 3' end of the RNA molecule, with an overhang at the 5' end which  
CC allows incorporation of the labeling nucleotide into the RNA molecule.  
CC The method, based on the synthesis of Okazaki fragments, is useful for  
CC labeling and modifying the 3'-termini of other nucleic acids such as DNA  
CC fragments. The method is a simple and efficient way of labeling or  
CC modifying RNA 3'-termini using DNA polymerase and a synthetic template  
CC with defined overhang nucleotides

XX PT Fibronectin scaffold protein array for obtaining a protein/compound which
XX PT binds to a compound/protein, comprises a fibronectin type III domain
XX PT having a randomised loop, a randomised beta-sheet or their combination.
XX PS Disclosure; Page 41; 67pp; English.
XX CC The present invention relates to an array of proteins (antibody mimics)
XX CC comprising a fibronectin type III domain having a randomised loop, a
XX CC randomised beta-sheet, or their combination, and has the capacity to bind
XX CC to a compound that is not bound by a corresponding naturally-occurring
XX CC fibronectin, immobilised onto a solid support. The antibody mimics is
XX CC useful for detecting a compound preferably a protein, in a biological
XX CC sample. It is also useful to detect one or more different analytes
XX CC simultaneously in a sample. Hence is useful for diagnostic purposes. It
XX CC is also useful for the purpose of designing proteins capable of binding
XX CC to virtually any compound of interest. The present sequence is a capture
XX CC probe used to self-assemble and anchor the tenth module of human
XX CC fibronectin module of type III (Fn3) (10Fn3) which is used in an
XX CC exemplification of the invention

XX PT New substituted aryl conjugates of parent molecules, especially
XX PT oligonucleotides, having improved transmembrane and intracellular
XX PT transport properties, useful as medicaments or diagnostic agents.
XX PS Disclosure; Page 9; 28pp; German.
XX CC This invention describes a novel conjugate (I) which consists of (A) a
XX CC molecule to be transported and (B) at least one aryl residue of formula -
XX CC Ar-(X-C(Y)-R_1)_n (II). Ar = group containing at least one aromatic ring;
XX CC X = O or N (sic); Y = O, S or NH-R_2 (sic); R_1 = optionally substituted
XX CC 1-23C alkyl (optionally containing double and/or triple bonds); R_2 =
XX CC optionally substituted 1-18C alkyl (optionally containing double and/or
XX CC triple bonds); n = integer of 1 or more. (A) is bonded to (B) directly or
XX CC via a chemical group, provided that the chemical group is other than CH_2
XX CC -S if the bond is via a phosphodiester linkage of (A). The invention also
XX CC describes (i) the preparation of a conjugate (I') of (A') a molecule to
XX CC be transported and (B') at least one aryl residue (not restricted to
XX CC (II)'), by preparing (A') containing a reactive function at the position
XX CC at which (B') is to be bonded, preparing (B') and reacting (A') and (B');
XX CC and (ii) the use of aryl groups (II) (optionally bonded via a chemical
XX CC group) for transporting (A) across biological membranes. The products of
XX CC the invention have cytostatic, virucide, vasotropic, dermatological,
XX CC antipsoriatic and antiasthmatic activity and can be used for gene
XX CC therapy. Conjugation of (A) with (B) is useful for transporting (A)
XX CC across biological membranes or into eukaryotic or prokaryotic cells
XX CC (specifically bacterial, yeast or mammalian cells, including human cells,
XX CC particularly tumor cells). Medicaments, diagnostic agents and test kits
XX CC containing (I) are also claimed. Typically (I) are antisense
XX CC oligonucleotide derivatives for tumor therapy; oligonucleotide drugs for
XX CC treating viral infections or diseases associated with integrins or cell-
XX CC cell interactions (e.g. restenosis, vitiligo, psoriasis or asthma); or
XX CC labeled oligonucleotides for in vivo diagnostic use, e.g. by in situ
XX CC hybridization. Conjugation with (B) markedly improves the cellular uptake
XX CC of (A), e.g. in tumor cells. (B) include fluorescein derivative residues,
XX CC in which case the conjugates (I) are fluorescently labeled, allowing
XX CC microscopic monitoring of cellular uptake etc. The cellular uptake of (I)
XX CC is superior to that obtained using other conjugated groups related to
XX CC (II); e.g. oligonucleotides conjugated with fluorescein diacetate (within
XX CC the scope of (B)) have superior uptake to corresponding fluorescein
XX CC conjugates

 XX Detecting and separating nucleic acid, useful e.g. for diagnosis,  
 PT comprises reaction with nanoparticles that carry oligonucleotides  
 PT complementary to parts of the target.  
 XX  
 PS Example 18; Page 158; 404pp; English.  
 XX  
 CC The invention relates to a method for detection of nucleic acid (I)  
 CC having at least 2 portions, comprising treatment with nanoparticles that  
 CC carry oligonucleotides complementary to at least 2 parts of (I), where  
 CC detectable change caused by hybridisation of the oligonucleotide to (I)  
 CC is observed. The method is used to detect (or to separate) specific (I),  
 CC e.g. for diagnosing a wide variety of diseases, sequencing, in forensic  
 CC analysis etc., and generally to detect analytes other than (I). The  
 CC oligonucleotide-derivatised nanoparticles are also useful for preparing  
 CC nanostructures useful, for example, as biochips, biofilters, mechanical  
 CC devices, separation membranes, chemical sensors, in computers, and for  
 CC drug delivery. Very stable nanoparticle-oligonucleotide conjugates can be  
 CC produced, allowing their direct use (as probes) in polymerase chain  
 CC reaction, i.e. they survive multiple heating/cooling cycles so do not  
 CC need to be added after amplification. (I) are detected by simple colour  
 CC change, without the need for special equipment making possible rapid  
 CC field testing for e.g. pathogens. AAS63374-AAS6348 represent  
 CC oligonucleotide-nanoparticle probes, and related sequences, used in the  
 CC method of the invention

 XX Detecting nucleic acid, useful for e.g. diagnosis of diseases, forensics  
 PT and DNA sequencing, comprises observing detectable change brought about  
 PT by hybridization of nucleic acid with substrate or particle bound  
 PT oligonucleotides.  
 XX  
 PS Disclosure; Page 199; 205pp; English.  
 XX  
 CC The present sequence is an oligonucleotide used in a method for detecting  
 CC a nucleic acid having at least 2 portions. The method comprises  
 CC hybridising the nucleic acid with oligonucleotides, such as the present  
 CC sequence, attached to a substrate and/or particle and detecting a change  
 CC in colour, conductivity or optical density. The method is useful for the  
 CC diagnosis and/or monitoring of diseases, in forensics, in DNA sequencing,  
 CC for paternity testing, for cell line authentication and for monitoring  
 CC gene therapy. Detecting nucleic acids based upon observing a colour  
 CC change is cheap, fast, simple, and does not require specialised or  
 CC expensive equipment. The nanoparticle oligonucleotide conjugates remain  
 CC stable for at least 6 months. A single base mismatch and as little as 20  
 CC femtomoles (fM) of target can be detected using the conjugates

XX PS
XX CC The sequence represents a cyclic disulphide linked oligonucleotide which
XX CC may be coupled with colloidal gold particles (nanoparticles) and used to
XX CC demonstrate the method of the invention. The invention relates to
XX CC isolating or detecting a nucleic acid of interest, in a mixture of
XX CC nucleic acids, by binding it to 2 or more complementary nucleotides which
XX CC have a nanoparticle attached to their 5' ends. The nanoparticles (e.g.
XX CC colloidal gold) are used to both isolate and detect (e.g. by linking the
XX CC particle to a fluorescent probe) the resultant complex. The methods are
XX CC useful for detecting nucleic acids, natural or synthetic, and modified or
XX CC unmodified. The methods may also be applied in the diagnosis of genetic,
XX CC bacterial and viral diseases, in forensics, in DNA sequencing, for
XX CC paternity testing, for cell line authentication, and for monitoring gene
XX CC therapy. The methods are further useful in research and analytical
XX CC laboratories in DNA sequencing, in the field to detect the presence of
XX CC specific pathogens, for quick identification of an infection to assist in
XX CC drug prescription, and in homes and health centres for inexpensive first-
XX CC line screening. The methods, which are based on observing colour change
XX CC with the naked eye, are cheap, fast, simple, robust (reagents are
XX CC stable), do not require specialised or expensive equipment, and little or
XX CC no instrumentation is required

XX XX
XX CC The present invention relates to a method for stimulating an immune
XX CC response. The method comprises administering an immunostimulatory nucleic
XX CC acid to a non-rodent subject in sufficient quantity to stimulate an
XX CC immune response. The present sequence is one such immunostimulatory
XX CC nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich
XX CC (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects
XX CC against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae
XX CC and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma,
XX CC haemophilus, campylobacter, clostridium, Escherichia coli and/or
XX CC staphylococcus), fungal antigens and/or parasitic antigens. The method is
XX CC also useful for preventing cancer, asthma, infectious disease, allergy or
XX CC immune deficiency. The present sequence can also be used to redirect a
XX CC Th2 to a Th1 immune response and to activate immune cells. Note: the
XX CC present sequence may have a phosphorothioate backbone

 XX Preparing sulfurized 2' substituted phosphorothioate oligonucleotides  
 PT useful in biological research, comprises phosphorylating the 5'-hydroxyl  
 PT of a nucleic acid having a nucleoside with a 2' modification.  
 XX Example 23; Col 11; 7pp; English.  
 XX The present invention relates to a method for preparing phosphorothioate  
 CC oligonucleotides having at least one nucleoside with a 2' modification.  
 CC The method comprises phosphorylating the 5'-hydroxyl of a nucleic acid  
 CC group having at least one nucleoside with a 2' modification in an  
 CC acetonitrile. The present sequence was used to illustrate the method of  
 CC the present invention. The method is useful for synthesising sulphurised  
 CC 2' substituted phosphorothioate oligonucleotides, which may be used in  
 CC molecular biological research, in applications such as anti-viral  
 CC therapy, and for determining the stereochemical pathways of certain  
 CC enzymes which recognise nucleic acids

 XX Screening nucleic acids (NA) in pool of interest comprises pooling,  
 PT expressing NA to form expression product pool and identifying NA in NA  
 PT pool corresponding to expression product pool having interaction with  
 PT target moiety.  
 XX Disclosure; Col 22; 19pp; English.  
 XX The specification describes a method for identifying a nucleic acid in a  
 CC pool of interest. The method comprises pooling individually identifiable  
 CC nucleic acids into at least two pools of one nucleic acid each;

CC expressing nucleic acid pools to obtain protein expression product pools;  
 CC assaying protein expression product pools for products having interaction  
 CC with target molecule; selecting nucleic acid pools corresponding to  
 CC identified protein expression product pools; and identifying individual  
 CC nucleic acids in identified nucleic acid pools. The method is useful for  
 CC identifying a nucleic acid (e.g. cDNA) in a pool of interest and for  
 CC functionally screening several nucleic acids. The method is also useful  
 CC for screening genomic DNA libraries or other source of individual cDNAs,  
 CC mRNAs, synthetic libraries of nucleic acids e.g. combinatorial libraries.  
 CC The present sequence was used in the course of the invention

 XX  
 XX Preparing novel deoxynucleic alkyl thiourea oligonucleotide for use in  
 PT antisense therapy, by synthesizing oligonucleotides comprising backbone  
 PT of alkyl or alkoxy thiourea linkages in solution or on solid phase.  
 XX Example 7; Fig 16; 48pp; English.  
 XX The present sequence was used to demonstrate the ability of deoxynucleic  
 CC S-Methylthiourae (DNmt) compounds to form triplexes with DNA oligomers. An  
 CC increase in the C content of the oligos resulted in a large decrease in  
 CC binding. This experiment was performed as an example of a method for  
 CC preparing oligonucleotides comprising a backbone of alkyl or alkoxy  
 CC thiourea linkages. The method is useful for preparing oligonucleotides  
 CC for use in antisense or antigene therapy, to inhibit production of  
 CC proteins associated with genetic diseases, cardiovascular, inflammatory  
 CC and neurocellular diseases, and for antiviral therapy, e.g. to treat  
 CC human immunodeficiency virus, human-cytomegalovirus, influenza and herpes  
 CC infections. The compounds are also useful as diagnostic reagents to  
 CC detect the presence or absence of the target DNA or RNA sequences to

CC which they specifically bind and by antagonising the normal biological  
CC activity of a target protein, they can be used in the manipulation of  
CC tissue e.g. tissue differentiation, both in vivo and in ex vivo tissue  
CC cultures. The method provides an efficient and rapid solid-phase method  
CC for the synthesis of thiourea and S-methylthiourea

 XX The present invention relates to methods for treating or preventing  
 CC cancer, involving administering to a subject having or at risk of  
 CC developing cancer immunostimulatory nucleic acids that induce expression  
 CC of cell surface antigens and antibodies. The methods are useful for  
 CC treating or preventing cancer such as basal cell carcinoma, bladder  
 CC cancer, bone cancer, brain and central nervous system (CNS) cancer,  
 CC breast cancer, cervical cancer, colon and rectum cancer, connective  
 CC tissue cancer, oesophageal cancer, eye cancer, kidney cancer, larynx  
 CC cancer, leukaemia, liver cancer, lung cancer, Hodgkin's lymphoma, non-  
 CC cancer, pancreatic cancer, prostate cancer, rhabdomyosarcoma, skin  
 CC cancer, stomach cancer, testicular cancer, and uterine cancer. The  
 CC present sequence is an immunostimulatory oligonucleotide described in the  
 CC exemplification of the invention

 PS

XX The invention relates to a method for detecting 1 base polymorphism on  
CC the sequence of a chromosome or its fragment in which a sample nucleic  
CC acid is reacted with a reaction liquor containing a nucleic acid primer  
CC having a base adjacent to the polymorphic base at its 3'-end, one  
CC dideoxynucleotide corresponding to a polymorphic base having a  
CC distinguishable feature or its mixture, DNA polymerase and a composition  
CC required for its activity expression to detect the presence of taking  
CC dideoxynucleotide in the nucleic acid primer and to detect the type of  
CC the base to be specified. The method is used for detecting 1 base  
CC polymorphism on the sequence of a chromosome or its fragment. The present  
CC sequence is that of a PCR primer, useful in examples of the invention

PT Detecting nucleic acid, useful for diagnosis of genetic, viral or  
PT bacterial disease, comprises hybridizing nanoparticles with attached  
PT oligonucleotides to nucleic acid and detecting change brought about by  
PT hybridization.  
XX  
PS Example 18; Page 410; 412pp; English.  
XX  
CC The invention relates to a method of detecting a nucleic acid (NA) having  
CC at least 2 portions comprising: (a) providing nanoparticles (NP) with  
CC attached oligonucleotides (OGN), where OGN has a sequence complementary  
CC to the sequence of NA; (b) contacting NA and NP under conditions  
CC effective to allow hybridisation of OGN with NA; and (c) observing a  
CC detectable change brought about by hybridisation of OGN with NA. The  
CC method is useful for detecting a nucleic acid, separating a selected  
CC nucleic acid from others and methods of nanofabrication. Detecting

CC analytes such as nucleic acids and proteins are useful for the diagnosis  
CC of genetic, bacterial and viral diseases. The OGN-NP conjugates that use  
CC cyclic disulphide linkers improve the sensitivity of diagnostic assays.  
CC In particular assays using OGN-NP conjugates prepared using linkers  
CC comprising a steroid residue attached to a cyclic disulphide have been  
CC found to be approximately 10 times more sensitive than assays employing  
CC conjugates prepared using alkanethiols or acyclic disulphides as the  
CC linker. The OGN-NP conjugates are stable allowing them to be used  
CC directly in PCR solutions. Therefore conjugates added as probes to a DNA  
CC target to be PCR amplified can be carried through the 30 or 40 heating  
CC cooling cycles of the PCR and are still able to detect the amplicons  
CC without opening the tubes and causing contamination. ABK64981-ABK65055  
CC represent nanoparticle-oligonucleotides of the invention

XX Novel antisense compound targeted to nucleic acid molecule encoding
PT clusterin, useful for treating animal having disease associated with
PT clusterin such as hyperlipidemic disorder, cardiovascular disorder.
XX Claim 3; Page 83; 125pp; English.
XX The invention comprises antisense oligonucleotides that are capable of
CC inhibiting expression of the human clusterin gene. The antisense
CC oligonucleotides of the invention are useful for inhibiting the
CC expression of clusterin in cells. The antisense oligonucleotides are also
CC useful for treating an animal with a disease or condition associated with
CC clusterin (e.g. hypercholesterolaemia; cardiovascular disorders;
CC hyperproliferative disorders; and hyperlipidemic disorders). The present
CC DNA sequence represents a clusterin antisense oligonucleotide of the
CC invention. NOTE: The present DNA sequence has a phosphorothioate backbone
CC and also contains 2'-O-methoxyethyl wings

XX CC The invention comprises antisense oligonucleotides that are capable of
CC inhibiting expression of the human clusterin gene. The antisense
CC oligonucleotides of the invention are useful for inhibiting the
CC expression of clusterin in cells. The antisense oligonucleotides are also
CC useful for treating an animal with a disease or condition associated with
CC clusterin (e.g. hypercholesterolaemia; cardiovascular disorders;
CC hyperproliferative disorders; and hyperlipidemic disorders). The present
CC DNA sequence represents a clusterin antisense oligonucleotide of the
CC invention. NOTE: The present DNA sequence has a phosphorothioate backbone
CC and also contains 2'-O-methoxyethyl wings
